At this unfavourable stage of the negotiation, a message came from the king to parliament, stating, that such preparations had taken place in the ports of France, as called upon his majesty to increase his armaments by sea and land. The French government protested, that they had no view in these preparations, but the quieting their own colony of St Domingo.

The resolution of France, to consider our refusal to evacuate Malta as the signal for hostilities, was announced in the ever memorable interview, when the French ruler insulted Lord Whitworth before all the ambassadors of Europe. Yet, as it was evidently not the interest of the first consul to go so soon to war, he recovered his irritation so far as to protract the negotiation. In the ultimatum offered by Britain, it was proposed, that we should retain Malta for ten years. France in return, proposed, that it should be ceded to Russia. Lord Whitworth left Paris with this offer to return thither no more, war being declared against France by his Britannic majesty, on the 18th of May 1803.

The invasion and occupation of Hanover by the French, was the most important of the early fruits of the war. (See HANOVER.). The preparations on the part of Britain, in the mean time, corresponded to the magnitude of her resources, and the patriotic spirit of her people, and the threats of invasion which were held out to her. Independent of the army of reserve, and of the regular and supplementary militia, 300,000 volunteers were immediately under arms. Expeditions were fitted out, which captured the settlements of St Lucia, Tobago, Essequibo, and Demerara; and the island of St Domingo was enabled to set France at defiance, by a British squadron which assisted the efforts of the blacks.

In a view of affairs so limited as the present, we should deem it unfair to pronounce upon the merits or demerits of Mr Addington's administration. After maintaining, for some time, a divided opposition, the par-

ties of Lord Grenville and Mr Fox coalesced; and Mr Pitt, who at first had favoured the Addingtonian cabinet, was gradually estranged, and at last avowedly hostile to it. As the country was supposed to be now in the most critical situation which she had ever experienced, the general voice of the community was in favour of an union of all men of weight and talents. This capable and comprehensive administration Mr Pitt, it was said, was as desirous as any man of seeing formed. He is said, by his friends, to have strongly urged his sovereign to the measure. But if such were his wishes, he acted in contradiction to them, and again consented to come into office in a new administration,* which commenced in May 1804. While the exclusive system of the restored minister was generally blamed, yet an increase of vigour in the conduct of affairs was expected from his superior talents. A considerable time, however, elapsed, without a single event to justify their hopes. Goree was taken by the French, but recovered. The only conquest within the year was the capture of Surinam, by a force which sailed from Barbadoes under General Green, and Commodore Hood. Some attempts were made on the enemy's flotilla by our single sloops and frigates, but with little success; and the experiment of blowing up the enemy's marine in their harbour by clock-work explosions, brought only ridicule on its projectors. Since the recommencement of hostilities, Spain had been suffered to preserve a neutrality, though obviously under the controul of France, and paying her a yearly tribute. Information, however, being received, that active preparations were making in her ports, and that French troops were passing through Spain to co-operate in her harbours, a British squadron was dispatched to intercept the Spanish frigates, which were conveying her specie from America to Cadiz. This service was promptly performed by captain Moore in the *Indefatigable*, and three frigates under his command. On the 5th of October, that officer fell in with four large Spanish frigates, and an engagement ensued, in which one of the enemy's vessels blew up, with the loss of 240 lives. The captured treasure was brought to England; but the justice of striking such a blow, before a declaration of war, was justly questioned. It was said, that the treasure ships were only meant to be retained as pledges, till satisfaction for her rumoured preparations should be given by Spain; and the blame of incurring bloodshed, was imputed to the obstinacy of the Spanish commander. That Spain was, at this period, left without a free will, and incapable of supporting even the limited neutrality which she had hitherto enjoyed, may well be supposed; but if war was necessary, it should have been openly declared; and, if it was intended to lay hold of the treasure ships without bloodshed, a larger force should have been sent, to which a Spanish commander could with honour have submitted.

The encroachments of Bonaparte in Germany and Italy, provoked a third coalition of the European powers against France in 1805. This event the French ruler had foreseen, and early in the same year had endeavoured to avert its approach, by pacific offers to great Britain. These were rejected with a promptitude which the insincerity of the enemy seems to have justified. His Russian imperial majesty subscribed to the alliance

* The other members were Lord Melville, first Lord of the Admiralty, vice the Earl of St Vincent; Lord Harrowby Secretary of State for Foreign Affairs, vice Lord Hawkesbury; Lord Camden for the war department and colonies, vice Lord Hobart; Lord Mulgrave Chancellor of the Duchy of Lancaster.

of Britain in the spring. In the month of August, Austria joined the league. Prussia was understood to be favourable; and Sweden joined in direct alliance. Bonaparte, who, with the vain threat of overrunning the British empire, had assembled the principal part of his forces opposite to the British coast, was perhaps relieved to find an opportunity of giving active employment to his troops, which had been stationary for two years. Having reinforced his army in Italy, he dismantled his flotilla at Boulogne; and collecting his troops from Hanover and Holland, reached the Danube with 200,000 men. His rapid annihilation of Mack's army, and his succeeding victory at Austerlitz, (which have been recorded under the article AUSTRIA,) laid Austria prostrate at his feet, overawed Prussia, and enabled him, for a time, securely to set Russia at defiance. By the treaty with the Emperor of Germany, which was concluded after the fatal field of Austerlitz, the Emperor of France became actually master of all Italy, except the Neapolitan dominions; for the sovereignty of the Pope might now be considered as merely nominal. Naples, Venice, and all its dependencies, were ceded by Austria; and he annexed Genoa to the French territory. He possessed the means of crushing the King of Naples as soon as his hands were disengaged; and that unfortunate power, by her precipitate devotion to the cause of the allies, had already furnished him with a pretext.

Amidst the victories of France, and even amidst her preparations which preceded them, the people of Britain watched with anxiety the motions of the enemy's fleet, one of which, composed of Spaniards and French, escaped to the West Indies, under the command of Admiral Villeneuve. The depredations of that commander were evidently restrained in that quarter by the terror of meeting with Lord Nelson, who, with inferior force, pursued him twice across the Atlantic. Returning to Europe, Villeneuve was reinforced to the number of 20 ships of the line, and encountered the fleet under Sir Robert Calder, off Cape Finisterre. In the action which ensued, Sir Robert Calder, with only 15 ships of the line, kept at bay his superior enemy, and took two of their large ships. The action, however, was not decisive, and the British admiral was prevented by the foggy weather and the state of his ships from renewing it next day—a disappointment to the sanguine hopes of his country—for which he dearly, and, perhaps, unjustly suffered, by receiving a reprimand from a court martial, for an error of judgment. This court took place on the 22d of July. On the 15th of September, Lord Nelson put to sea, and arriving off Cadiz, received the command of the fleet on that station from Admiral Collingwood. About the middle of October, having received certain information that he would be joined in a day or two by a reinforcement of seven sail of the line from England, he boldly detached Admiral Louis with six ships of the line upon a particular service, in so open a manner as to be seen by the enemy. This manœuvre deceived Admiral Villeneuve, who, believing that the British fleet was reduced to 21 sail of the line, while the combined French and Spanish fleet counted 33, resolved to retrieve his fallen fame, by encountering Nelson himself. He accordingly ventured out from Cadiz with a light westerly wind. Lord Nelson having received his expected reinforcement, immediately sailed in pursuit of him; and on the 21st of October, descried the combined fleet about seven miles to the eastward of Cape Trafalgar. The commander in chief immediately gave

the signal for the fleet to bear up in two columns, as they formed in the order of sailing. Lord Nelson in the Victory, led the weather column; Admiral Collingwood, in the Royal Sovereign, led that of the lee. Villeneuve had formed his ships in one line; but as the mode of attack was unusual, so the structure of his line was new, forming a crescent, convexing to leeward. Nelson's last signal was, "England expects every man to do his duty." It was received with a shout throughout the fleet. About noon the dreadful contest began, by the leading ships of the British columns breaking through the enemy's line, which was first effected by Admiral Collingwood. The succeeding ships breaking through in all parts astern of their leaders, engaged the enemy at the muzzles of their guns. At twenty minutes past twelve, the action became general. Lord Nelson ordered his ship, the Victory, to be run on board the Redoubtable, while his second, the Temeraire, run on board the next adjacent ship, and in a short time, the four contending vessels were closed in one mass. After a general and furious engagement, continued for several hours; about three P. M. Admiral Gravina, who carried the Spanish flag in the rear, bore away to Cadiz. Five more of the headmost of the enemy, under Admiral Dumanoir, tacked and stood to the southward. They were engaged, and the sternmost taken, and nineteen ships of the line remained in all to the British. Of these, two were first rates, and none were under 74 guns. At forty minutes past four, all firing ceased, and a complete victory was announced to Lord Nelson, who, having been wounded early in the action, survived just to hear the joyous tidings, and died, as he had lived, with heroic fortitude. It is fresh in every memory, how much the public mind required such a victory to console it, amidst the dismay and consternation produced by the misfortunes of Austria; yet it was, perhaps with no great exaggeration of Nelson's merits, said of the battle of Trafalgar, that it did not recompense his country for his loss. Two days after the engagement, ten ships of the enemy, the remnant of their fleet which had suffered least in the action, ventured out from Cadiz, in the hopes of attacking some of the British ships which were damaged and scattered by the tremendous state of the weather. But they were repulsed by Collingwood, and one of their line was added to the captures. It was necessary, however, to destroy several of the prizes; nine were wrecked; four were brought to Gibraltar; Dumanoir, who had escaped with four ships, at the close of the action, fell in with Sir Richard Strachan off Ferrol, and struck, after a hard contest.

After the capture of Tippoo Saib's capital, and the death of that potentate, the East India Company seemed for a time to be left without a rival in their eastern empire. Yet in that extensive territory of the Mahrattas, extending nearly a thousand miles, from Delhi to the river Tumbudhra, and from the Bay of Bengal to the Gulf of Cambay, nearly an equal breadth, comprehending a population of 40 millions of people, it might be naturally expected, that chieftains, of formidable power and consequence, should view, with jealousy, the approach of European conquerors. Among the Mahratta chiefs, the most powerful at the commencement of the present century, were Dowlut Rao Scindiah, and Jeswunt Rao Holkar. With the former of these potentates, war was commenced by the British in the beginning of 1803, and prosecuted with brilliant success. On the north-western frontier of Oude, General Lake suc-

cessively defeated the army of Scindiah, and overwhelmed the forces of Mons. Perron, a French soldier of fortune, who commanded a corps of Europeans in the service of the Indian prince. In the Deccan, General Wellesley followed up a splendid career of victory. The result was to bring Scindiah, and his ally the Rajah of Berar, to a treaty, by which the Mahratta princes ceded a large territory to the company, and acknowledged the protection of the British government.

Scarcely had Scindiah been suppressed, when another enemy equally formidable arose, in the Mahratta chieftain Holkar, formerly the inveterate rival of Scindiah, but recently united with him by their common enmity to the British. General Frazer, on the 13th of Nov. 1804, attacked and defeated his infantry and artillery, near one of his fortresses called Deeg, and obtained a most important victory. Lord Lake, in the November of the same year, surprised the whole force of his cavalry, under the personal command of Holkar, near the city of Ferrackabad, with equal success, and the Indian prince escaped with difficulty from the disastrous field. After these successes, Lord Wellesley returned to Britain. His government, though distinguished by many victories, had been expensive and ambitious. When his successor in the government, Lord Cornwallis, arrived at Calcutta, he found the finances of the country in a most deplorable state, and, without some great reduction of expenditure, quite unable to meet the contingencies of war. The native princes, though defeated, were still able to harass and employ our force. From the extent of their territory, from the numbers of their cavalry, and the hardy and wandering habits of their irregular troops, they were able to survive defeats, and rally after dispersion. Holkar was still in arms, and Scindiah, with whom a peace had been made, had imprisoned the company's resident, and prepared anew for hostilities. The death of Lord Cornwallis unhappily deprived our eastern empire of his services, before he had lived to witness the effects of the pacific system which he went out to substitute, in the room of that of his predecessor. But his efforts were not in vain; and his system was happily pursued by others when he was no more. Peace was concluded with both Holkar and Scindiah before the end of 1805. The territories of the latter were abridged and limited on the north to the river Chumbul, but a pecuniary compensation was settled upon his family.

Holkar renounced some of his possessions to the north of the Boundee hills, and in the possession of Bundelcund, but for these he received the indemnity of a Jaghire, to be settled on his daughter, while the company pledged themselves to leave him in quiet possession of his territories to the south of the Chumbul, and to restore his conquests in the Deccan.

The single reputation of Mr Pitt, which had erected a ministry independent of three powerful parties in parliament, (the friends of Lord Grenville, Mr Fox, and Mr Addington) was not found sufficient to support it. When it was asked by what tokens of superior genius the war had been conducted since Mr Addington's resignation, it was not easy to point them out. A new

coalition had been roused against France, but though long in prospect, it had been supported by no adequate efforts on the continent. We had assisted Austria by no diversion in the north of Europe, and troops had been landed at Naples after the fate of the campaign had been decided. Instead of co-operating with the allies in Europe to our utmost power, an expedition had been fitted out to acquire a colony at the other extremity of the globe. The colleagues of Mr Pitt, excepting Lord Melville, had still less reputation than ability. The impeachment of that statesman being followed by his removal from office, left Mr Pitt without an associate of acknowledged talents. Previous to that event, the minister, conscious of the weakness of his cabinet, had invited and received Mr Addington, now created Lord Sidmouth, to participate in his councils; but the vote of Lord Sidmouth in favouring the impeachment of Lord Melville, separated that statesman once more from his councils.

Amidst the gloom of his political prospects, the health of the minister rapidly declined towards the conclusion of the year. After an illness of some months, this extraordinary man, who, solely by the weight of his talents, had continued to direct the councils of his country, expired on the 22d of January 1806; and his death was a virtual dissolution of his ministry. See *PITT*.

A feeble attempt was indeed made to continue a ministry on the system of excluding from office the statesman who possessed the greatest share of public estimation, but it did not succeed. Lord Hawkesbury declined the succession to Mr Pitt's situation; and, after some discussions with the court, Mr Fox and Lord Grenville obtained the chief terms which they sought, and came with their respective friends into office. These discussions were understood to relate to the share of authority which his Royal Highness the Duke of York was to possess over the army. Lord Sidmouth acceded to the new ministry, and, with several of his friends, also came into power.*

One of the first objects of the attention of the new ministers, was the alteration of the system of military defence organized by their immediate predecessors. By the defence bill enacted under Mr Pitt, 40,000 men had been raised for the army of reserve; but of those, there were only two thousand that were drawn who served in person. Thirty-eight thousand were thus raised by private individuals. The operation of the ballot was not only partial and unjust, as it fell not upon the state, but on private individuals; but in consequence of the competition of so many unpractised recruiting officers, the price of substitutes rose to such a height as to impede the recruiting for the regular service, and the frequency of desertions was alarmingly increased. In the new plan of defence, it was proposed to substitute regular enlisting for balloting, and to hold out additional motives for men to embrace the military life, by improving the condition of the soldier, and changing the duration of his service from a lifetime to a limited period. In their financial schemes, the new ministers wisely adhered to a system on which their predecessors had for some time acted, of rather pressing on the present generation

* The new cabinet was thus composed: Lord Grenville, First Lord of the Treasury; Earl Spencer, Mr Fox, and Mr Windham, Secretaries of State for the Home, Foreign, and War Departments; Lord Henry Petty, Chancellor of the Exchequer; Lord Howick, First Lord of the Admiralty; Earl Fitz-William, Lord President of the Council; Viscount Sidmouth, Lord Privy Seal; Earl of Moira, Master of the Ordnance; Lord Erskine, Lord High Chancellor; Lord Ellenborough, Lord Chief Justice; the Duke of Bedford, Lord Lieutenant of Ireland; and Mr George Ponsonby was made Keeper of the Irish Seals.

than leaving loads to posterity. They raised the war taxes from fourteen to nineteen millions. They increased the income-tax to 10 per cent. on all incomes exceeding 50*l.* with great allowances, however, to those under 100*l.*

Whatever popularity the new ministers might lose by this heavy tax, they certainly redeemed it by the laudable attention which they shewed to deliver the public from the enormous abuse of inaudited public accounts. These accounts, when they came into office, amounted to upwards of five hundred millions. Not a single account in the army office had been audited since 1782. The store accounts had been suffered to lie over since the same period. The navy accounts were greatly in arrear. When Mr Pitt began his long administration, he had found a similar accumulation of inaudited accounts, and had established a new board of auditors. But fresh accumulations had arisen from many obvious imperfections in his first plan of the board of auditors. Nor had the same minister's later bill in 1805, for increasing the number of auditors, provided effectually for the regular execution of their duty.

It was the object of the present plan to secure that the public accounts of every year should be regularly audited in the course of every ensuing year, so that no fresh accumulation should occur. At the same time, the wholesome principle of the great reforming revenue bills, viz. that of Mr Burke for regulating the office of the paymaster of the forces, and Mr Dundas's bill for regulating the office of the treasurer of the navy, was applied to the excise office, the post-office, and the custom-house.

It has been already noticed, that the whole of Mr Pitt's influence, while yet a minister, could not avert from his late associate in office, Lord Melville, a vote of the House of Commons, that there were grounds for criminal impeachment against his Lordship in the management of public money.

The trial of that nobleman commenced in Westminster-hall on the 29th of April. Ten days were employed by the managers in bringing forward and examining their evidence, and in the speeches of Mr Whitbread, who opened the case, and of the Solicitor General, who summed up the evidence. The evidence and arguments of the counsel on both sides, closed on the 17th of May, and sentence of not guilty was pronounced by a majority of the peers on the 12th of June.*

An expedition against the Cape of Good Hope had sailed from England in the autumn of 1805, at the moment when hostilities were breaking out on the Continent. The force destined for the conquest of the Cape, consisted of about 5000 land troops, under Sir David Baird, and a proportional naval force, commanded by Sir Home Popham. They reached their destination on the 4th of January 1806. Sir David Baird commenced his march to Cape Town on the 8th. On the same day, when the army had reached the summit of the Blue Mountains, they perceived the enemy to the number of 5000, drawn up

on the plain to receive them. By the gallantry of the Highland brigade, under General Ferguson, who commenced the attack, they were routed, after a short resistance, and General Janssens, the commander in chief, who retired with a remaining body to a pass in the interior of the country, soon after accepted of honourable terms: he was allowed with his troops to return to Holland, on condition of the colony and its dependencies surrendering.

Sir Home Popham, the naval officer, whose co-operation had so materially aided this conquest, had held several consultations with the late ministers (Mr Pitt and Lord Melville,) about the project of invading Spanish America; but he had been afterwards distinctly informed, that no such measure should be adopted at present, from deference to Russia. Flushed, however, with his conquest at the Cape, and influenced by the hope of public as well as private gain, he embraced the bold and unauthorized resolution of attempting some exploit in the Rio Plata; and persuaded Sir David Baird to acquiesce in his plans, so far as to furnish him with a small portion of his troops. In the month of June, he entered the Rio Plata with a force under General Beresford, not exceeding 1600 men. On the 24th of June, having disembarked about 12 miles from the city of Buenos Ayres, the British forces captured the place with great facility, the enemy flying before them wherever they appeared, and abandoning their artillery. While our little army was thus employed in the conquest of Buenos Ayres, the line of battle ships made demonstrations before Monte Video and Maldonado, to alarm the garrisons. At those two places all the regular troops had been detained; while the city, defended by a raw militia under the conduct of a timid and unskilful viceroy, had yielded by surprize to its assailants. An important conquest was thus achieved, and a booty to the amount of several millions of dollars was acquired. But when the Spaniards beheld with shame the small number of their conquerors, a project was soon matured for rising upon the British troops. Liniers, a colonel in the French service, landed above Buenos Ayres with above 1000 men, armed levies from the country, attacked the town, and though repulsed, persevered in returning to the charge. At last, after a hard battle with the insurgents in the streets of the town, the English were overpowered, and obliged to surrender as prisoners. Sir Home Popham, with reinforcements from the Cape, made an attempt to recover Monte Video, but was obliged to desist. A body of troops, under Colonel Vassal, were more successful in securing the post of Maldonado, where they remained to receive fresh succours from home, and to prepare for another campaign, still more disastrous than the last.

Prussia, after much hesitating and negotiation, had been at last impelled, by the violation of her territory, to draw out her troops against France; when the news of the battle of Austerlitz and of the armistice, again terrified her into feeble councils. The result of these

* The charges against Lord Melville, though multiplied by the managers of the impeachment, were in fact only three in number. The first was, that before the 10th of January 1786, he had, contrary to the obligation imposed on him by the warrant appointing him treasurer of the navy, applied to his private use and profit, several sums of public money entrusted to him in that capacity. The second was, that after the passing of the act of parliament in 1785, for the better regulating the office of treasurer of the navy, he had, in breach and violation of that act, permitted Mr Trotter, his paymaster, illegally to take from the Bank of England, for other than immediate application to navy purposes, large sums of money, from the monies issued to the Bank on account of the treasurer of the navy, and place the same in the hands of his private banker, in his own name, and subject to his disposition and controul. The third charge was, that he had fraudulently and corruptly permitted Mr Trotter to apply the money so abstracted illegally from the Bank of England, to purposes of private use and emolument, and had himself derived profit from them.

was, that her minister Haugwitz, signed a treaty at Paris, by which Prussia became the ally of France; the guarantee of her conquests in Germany, and her associate in the spoils of the vanquished coalition. This infamous affair was speedily made known to Europe. It was declared in a proclamation, that his Prussian majesty had formally annexed to his dominions the Electorate of Hanover, belonging to *the Emperor Napoleon by right of conquest*, and transferred to Prussia in return for three of her provinces. The ports of the German ocean were also declared to be shut against British trade and shipping. The conduct of Prussia in thus humbling herself to a vassalage of hostility, left Britain no choice but retaliation against her commerce and navigation, and her flag, for a time, disappeared from the Baltic.

The peace of Presburg, which the Emperors of France and Germany signed after the battle of Austerlitz, and the treaty concluded with Prussia, left Bonaparte at liberty to take vengeance on the court of Naples. He accordingly issued a proclamation, from his head quarters at Vienna, declaring that the Neapolitan dynasty had ceased to reign. Fourteen thousand Russians and ten thousand English had landed in that kingdom, with a view to produce a diversion in favour of the Austrians in Lombardy; and the king of the two Sicilies had evinced a determination to support their operations. But the catastrophe of the allies in Germany, proved too late the futility of the enterprize. Scarcely had the dreadful threat of Bonaparte reached his Sicilian majesty, when a courier arrived from the Emperor Alexander, recalling the Russians to Corfu. The retreat of the English followed as a necessary consequence. Sir James Craig, their commander, wisely determined to retreat to Sicily, without waiting for the arrival of the enemy; and the king and queen of Naples, thus abandoned to their fate, sought refuge, as before, at Palermo. After the evacuation of Naples, Sir James Craig established his head quarters at Messina, as the station best adapted for protecting Sicily from invasion; while Sir Sidney Smith, with a squadron of five ships of the line, and a force of frigates and gun-boats, protected it by sea; insulted the territory of the new sovereign of Naples, (Joseph Bonaparte,) and took possession of the island of Capri. In April 1806, the command of the troops in Sicily devolved on General Stuart, who, for his services, was rewarded with the red ribband, from the bad health of Sir James Craig, who returned to England. It was of the utmost consequence that Sicily should be preserved from the power of France; and it was, therefore, with difficulty that General Stuart agreed to diminish his small force, by co-operating with the schemes of the court of Palermo, for exciting insurrections on the coast of Calabria; but prompted, at last, by accounts of the favourable disposition of the Calabrians, and hoping to destroy the resources of the enemy for invading Sicily, he consented to land a part of his army on the continent, and make trial of the loyalty of the people to their former sovereign.

Four thousand eight hundred effective men were landed on the morning of the 1st of July, in the Gulf of St Euphemia, near the northern frontiers of lower Calabria. The British commander's proclamation, inviting the inhabitants to his standard, attracted so few, that he was hesitating whether to reembark his troops, when he learned that General Regnier, with a French army nearly equal to his own, was encamped at Maida, about 10 miles distant. Understanding also that the

enemy expected reinforcements, he determined to anticipate their arrival, and advanced, next morning, to attack Regnier. The two armies were separated by a plain, from four to six miles in breadth, extending from sea to sea, and bounded on the north and south by chains of mountains. Regnier occupied a strong position, which he abandoned in the confidence of superior numbers, and in contempt of the British troops, and advanced with seven thousand men to charge them on the plain. The British, only four thousand eight hundred strong, were surprized, but not dismayed at the numbers of their antagonists, and advanced with alacrity. Regnier had taught his men to believe, that they would fly on the first charge—a presumption which was quickly changed into astonishment, when they saw the ranks of our countrymen advancing rapidly to meet their charge. The action began on the right of the British, and after some firing, both sides prepared for the bayonet.

As the French came on, their line grew uneven, one part of it halting at some distance, another venturing nearly to cross bayonets with our men; but, on the point of contact, they turned and fled. They were overtaken with immense slaughter, and their left wing totally routed. On the right, the enemy made an effort to retrieve the day; but were also repulsed by the steadiness of the English left, and their cavalry being thrown into disorder, in an attempt to turn the English flank, by a fire from the 20th regiment, which landed during the action, and came up at this critical juncture, they abandoned the field with precipitation, leaving in prisoners, wounded and killed, not less than 4000 men.

Brilliant as the victory of Maida was, it contributed only to the glory of the national arms, and in no way to the recovery of Calabria. The capture of Gaeta by the French, more than counterbalanced its effects on the affairs of Italy. The mass of Calabria, who had risen, and were still disposed to rise upon the troops of Joseph Bonaparte, might protract a desultory warfare, till Massena approached to overwhelm them; but their insurrections were so evidently inadequate to offer a permanent resistance to the conqueror, that the British commander wisely returned to Sicily; and the subsequent solicitations of the court of Palermo to succour them with British forces, were refused, as inconsistent with the superior object of defending Sicily. In their zeal for insurrectionary movements, the deposed king and queen of Naples were little disposed to consider the calamities which they occasioned. But it was abhorrent to the humane breasts of their British allies, that bloodshed and misery should be continued for no better purpose than to gratify a fallen court with the occasional punishment of its enemies, inflicted by outlaws and banditti; for, by such characters, the Neapolitan mass were, in general, conducted.

Such an action as that of Trafalgar was not to be yearly expected; but the British navy maintained its accustomed superiority in 1806. In the West Indies, Sir Thomas Duckworth captured three French ships of the line, and drove ashore and burnt two others, a portion of the fleet which had escaped from Brest. The French admiral Linois, who had long infested our commerce in the East, was intercepted on his return by Sir John Borlase Warren, and brought to England, with an eighty gun ship, and a forty gun frigate.

Prussia found no safety in humiliation. She disco-

vered that Bonaparte, who had compelled her to hostilities with Sweden, had engaged to Russia, to prevent her from depriving the king of Sweden of his German territories; and after guaranteeing to her the possession of Hanover, that she was negotiating with England on the basis of restoring that electorate. After selling her honour, she had been defrauded of the price. Indignation at the treachery and impatience of the insolence of Bonaparte, at last decided her councils to hazard the die of war. Information was no sooner communicated to the English ministry, of the desire of the cabinet of Berlin to return to a state of amity with Britain, than Lord Morpeth was dispatched to the head quarters of the Prussian army, there to negotiate for peace. These he reached at Weimar, on the 12th of October. But the same impolicy and insincerity, which had before disgraced the councils of Prussia, were still visible in her conduct. She had entered on the awful crisis of a rupture with France, without informing England of her resolution. She now hesitated and shifted at the prospect of negotiating for peace with us, knowing, that the restoration of Hanover would be required. If she lost the impending battle, all would be lost. If she gained it, she hoped to retain Hanover independent of Britain. Her minister Luechesini, therefore, unguardedly answered Lord Morpeth, when he asked if his court was ready to enter on immediate negotiation, that it would depend on the issue of the battle which had just been fought. The battle of Auerstadt had been already fought, but the result was not yet known at the place where this was spoken. It is needless to add, that the battle of Auerstadt put it beyond the power of Frederick to negotiate farther with Great Britain. Before the short and awful struggle had commenced, which decided the existence of Prussia, an accidental circumstance,* which brought on a personal correspondence between the ministers of France and England, drew forth the only serious proposals for peace, which had been made since the renovation of the war. It is of small consequence to detail the particulars of a treaty which ended so unfortunately. As soon as it was obvious, that the abandonment of Russia was to be the price of the favourable terms, so ostentatiously at first promised to Britain, the determination of our court not to listen to any such projects, prevented a precise detail of the concessions which France was willing to make for the attainment of her object. It is, however, worthy of remark, that no offer of Sicily, the great object for which Mr Fox had contended, was ever made, even in the supposition of a separate peace. An attention not only to the interests, but to the wishes of Russia; a firm determination to listen to no measure, that could give her umbrage or suspicion; and a strong desire to preserve Sicily, almost a resolution not to abandon it,—were the prominent features of the conduct of Britain during this negotiation. Mr Fox, whose health had been for some time declining, did not live to know, though he strongly anticipated, the issue of the negotiation. On the 13th of September, that illustrious statesman breathed his last. See Fox.

Bonaparte lavished abuse on his survivors in the British cabinet, for departing from the sincere and

peaceful views with which Mr Fox had commenced the treaty. But their popularity was in no danger of being hurt by that imputation; for, independent of the charge being wholly false, the British public were rather disposed to be jealous of peaceful views in their rulers, than to doubt their sincerity. Since the commencement of the present war, the universal cry has been the danger of a peace. On the present occasion, the nation were less disposed to shudder at the prospect of protracted war, than at the retrospect of the perils which they had escaped of an insidious treaty. The death of Mr Fox was not immediately fatal to his ministry. At the recommendation of Lord Grenville, his majesty was pleased to appoint Lord Howick to the foreign department, Lord Sidmouth to the presidency of the council, and Lord Holland, the only new member who was brought into the administration, to be lord privy seal. A dissolution of parliament took place, and the elections were, in general, such as to furnish a parliament, which promised to be more favourable than the last to the present administration.

After the fatal and dreadful battle of Auerstadt, Bonaparte pursued his career to Berlin, with no resistance from the broken remains of the Prussian army, except from the small and single band of the gallant Blücher, who at last surrendered at Lubeck, after the city had been taken by storm. At Berlin, the conqueror, whilst he was erecting new kingdoms and dukedoms, published his famous decree against the commerce of Britain, by which he declared the whole island in a state of blockade. He set out from thence to pursue the king of Prussia across the Oder, whilst the garrisons of that unfortunate monarch, either from panic or treachery, seemed to be emulous which should be the first to surrender.†

One of the capital errors of Prussia had been to rush into the contest with France, without waiting for the co-operation of Russia. On the first intimation of her danger, the Russian troops advanced through Poland, and, as if they had hoped to retrieve one fault by committing another, exactly imitated the example of their defeated ally, in precipitately meeting the French. General Beningsen, at the head of their first division, reached Warsaw before the French. A check, which he received on the Vistula, taught him the necessity of retreating behind the Narew, where he was joined by the divisions of Buxhoveden and Kamenskoy, the latter of whom was appointed to the chief command of Alexander's forces. From the Narew, the Russian columns made a second retreat, broken and discomfited, and were saved only by the badness of the roads, which impeded the progress of the French artillery. At that critical moment, the Russian generalissimo Kamenskoy left his army, and retired to Ostrolenka. It was given out that his understanding was deranged. A very different account of his conduct is not discredited by the issue of the campaign. He was old in military experience, and is said to have been the only one of the Russian generals, who saw the danger of their situation, and to have left the army in disgust and despair, when he found his authority insufficient to curb the impetuosity of the younger generals, who were

* The circumstance of a Frenchman, (who afterwards proved to be disordered in his intellects,) having communicated to Mr Fox his intention of going to France to assassinate Bonaparte, occasioned a letter from Mr Fox to the French government, describing the individual. He was arrested at Hamburg.

† With some exceptions, Great Glogaw and Breslaw made a creditable resistance.

determined on risking another engagement. Benning-sen and Buxhoveden accordingly fought at Pultusk, and at Golymyn. The latter claimed a victory, his antagonists did the same. Of the murderous conflicts on these new scenes of warfare, it is not easy to separate the real from the falsified accounts on both sides; but the indisputable trophies of 80 pieces of cannon taken from the Russians, which their enemies brought back to Warsaw, left room to suppose, that the severest loss was not upon the side of the French. After the battle of Pultusk, the French retired into winter quarters on the Vistula; the Russians fell back to Ostrolenka, on the Niemen. The command of the army after the battle of Pultusk, was given to Benningsen, who joined with Buxhoveden, after the undeniable defeat of that general at Golymyn.

The plan of Benningsen was to turn the left flank of the French army, and his eye was therefore kept upon the Vistula; while Bonaparte, perceiving that his enemy meant to give him no rest in his winter quarters, directed his view to the Pregel and the Niemen, and determined to anticipate the attack. At Mohringhen, a general action was brought on, where, as usual, both sides claimed the victory. In this, as well as in the tremendous battle of Eylau, which succeeded to it, the claims of the Russians, to the honour of checking Bonaparte, are not without appearances of justice. If the French emperor buried their dead at Eylau, took a number of their artillery, and remained seven days on the field after the latter battle, he failed, through the obstinacy of their resistance, in fulfilling his promise of being at Konigsberg. Inspired by the unexpected circumstance of even a doubtful contest with Bonaparte, the public sanguine expectation made no distinction between the efforts which might keep him at bay for a short time, and those which should destroy him. But if Russia possessed, at any moment, either generalship or physical force to combat France, it can only be said, that they both declined instantaneously after the battle of Eylau. It seemed as if the understanding of her leaders, as much as the numerical power of her armies, had been wasted in the agony of her struggle. A number of actions in the spring campaign of 1807, in the intermediate time between those of Eylau and Friedland, displayed the superior tactics of the French, and in spite of all her reinforcements, the decreasing strength of her army. Yet, after all the successes of Jerome Bonaparte in Silesia, and even after 40,000 French troops were added to the main army of Bonaparte, by the capture of Dantzic, the Russians persisted in the plan of coming to a general and decisive action. The battle of Friedland was indeed decisive.

With a wanton and ambitious confidence in her own strength, Russia had so timed her attack upon Turkey, as to have 30,000 of her troops invading Wallachia and Moldavia during the crisis of her struggle with France. A revolution in Constantinople, which placed Mustapha IV. on the throne of the empire, took place during the approach of the Russian armies. It was ascribed, by the French, to the influence of English gold; but it was, in truth, unconnected with politics, and wholly prompted by the resentment of the Janissaries, at some recent innovations which had been made by the government, supposed to be favourable to the Christians. The new Turkish sovereign fell, like his predecessor, into the

French influence; a natural consequence of the hostility of Russia, although the Russians declared, that they only wished to rescue the Ottoman empire from the grasp of Bonaparte. Whilst the influence of Sebastiani, the French resident, was sensibly gaining ground, our minister, Mr Arbuthnot, wrote home to our government the state of affairs, and, at his instance, as well as by the advice of the Russian minister at Petersburg, a British fleet was sent out under the command of Sir John Duckworth,* to give weight to the joint negotiation of England and Russia with the Porte, for concluding a peace. Our naval force cast anchor at the isle of Tenedos about the middle of February, where it was joined by a British frigate from the harbour of Constantinople, on board of which Mr Arbuthnot, in the fear of personal violence, made his escape. On the 19th, our fleet passed the Dardanelles, and, at the outer castle, as a mark of forbearance, made no return to the fire of the Turks. But in passing the narrow strait between Sestos and Abydos, they were obliged to answer a very heavy cannonade, which was opened from the inner castles. Within these, a small Turkish squadron was destroyed by Sir Sydney Smith, and a formidable battery was spiked by the marines. After this a fruitless negotiation commenced, which lasted for several days, during which time the Turks had time to construct most formidable batteries along the shore. In this work, the population of the Turkish capital and its neighbourhood, inspired by unbounded enthusiasm, were employed from the highest to the lowest orders, till they had mounted batteries and breast-works with 600 pieces of artillery. They were directed by French engineers, whom the sultan had obtained from Dalmatia at the breaking out of hostilities with Russia. In the mean time, the British admiral and ambassador offered to withdraw beyond the Dardanelles, even should the proffered amity of England and Russia be declined, if the Porte would deliver its fleet and naval stores. In the event of a refusal, they threatened Constantinople with bombardment. But during the whole negotiation, if we may credit Sir John Duckworth, it was not in the power of the British squadron to put their threat in execution; for although they had cast anchor within a few miles of the city, the state of the weather would not have permitted them to maintain a station so near as to bombard it. Had the Turks been allowed another week to complete their batteries, the very return of the British squadron would have been doubtful. From this peril the British admiral was glad to make his escape, and to forego the threatened assault of a city, defended by 200,000 enemies, of which the destruction, had it been possible, would have been an unprofitable act of vengeance. On the first of March, he weighed anchor to re-pass the Dardanelles, a return, which was not effected without peril and loss. The Turkish mortars, in short, discharged bullets and blocks of marble of incredible size upon our ships. One of these, weighing 800 pounds, cut the main-mast of the Windsor Castle man of war in two, and the ship was with difficulty saved. In this unhappy enterprize, we lost 250 men.

The failure of this expedition was not compensated by the next attempt that was made upon our Turkish enemies.

On the 6th of March, a force of 5000 men was dispatched, by General Fox, from Messina, under the

* It consisted of 7 ships of the line, two of them three-deckers, besides frigates and gun-boats.

command of General M'Kenzie, to capture Alexandria; a service which was effected with little difficulty or bloodshed on the side of the British; but, unfortunately, from a groundless fear of scarcity in the captured place, an attempt to take Rosetta also was made, and from the failure of the expected aid of the Mamelukes, as well as from the orders of the commander in chief to the storming party being intercepted, a large force of the British were surrounded and cut off. Nearly 1000 men were killed, wounded, or lost in the affair.

Before this attack on Alexandria was known at home, a new ministry had succeeded, and the successors of those who had planned the expedition did not choose to support it by reinforcements from Sicily or Malta. This disposition, we may presume, was known to the commanding officers at Alexandria, who being now threatened with expulsion by the disaffection of the inhabitants, and with fresh attacks of the enemy, who were pouring down troops from Cairo, abandoned the idea of defending the place, and consented to evacuate Egypt, on condition of the Turks restoring the prisoners who had been taken at Rosetta. Having obtained those terms, the British troops returned to Sicily.

The event of Sir Home Popham's unauthorized expedition to Buenos Ayres, had left the remnant of the British forces in that quarter, at the end of 1806, in possession of only the single post of Maldonado. Unlike the administration which succeeded them, in their conduct respecting Alexandria, the ministry of Lord Grenville, though they disapproved of the expedition, did not choose that the national glory should be sullied, by being driven from a conquest which had once been made.

When intelligence of the recapture of Buenos Ayres reached ministers, they dispatched counter-orders to General Crawford, who had been sent on an expedition to Chili, to desist from that enterprize, and to repair to the Rio de la Plata. The whole British force in the Plata now amounted to 9500 men.* Unhappily ministers superadded to their orders, that General Whitelocke should sail to take the *chief command*. At the head of nearly 8000 of these troops, some of the

finest brigades in the British service, that ill-starred commander proceeded to attack the city of Buenos Ayres.

Though provided with artillery he sent on the troops with unloaded arms, and iron crows, to force their way into the town, and burst open the houses. The result of a plan (if it deserved such a name) so desperately rash, was to give an undisciplined enemy, fighting from behind walls and houses, the greatest advantage that could be given them over regular troops. Some of our troops, indeed, forced their way into the town, by successful gallantry, but a great proportion were overpowered by irresistible numbers. Terrified by the loss of three thousand men, who were sacrificed in the rash attempt, the general negotiated with the enemy for the restoration of the prisoners; and having agreed to withdraw his army from the river Plata, returned to England to await the just indignation of his countrymen. He was condemned, by a lenient sentence, to be dismissed from his majesty's service.

On the 1st of January 1807, the island of Curaçoa surrendered to a small squadron of frigates, under the command of Captain Brisbane; and the inhabitants of its chief town, Amsterdam, to the number of 30,000, swore allegiance to the British government.

The termination of Lord Grenville's short administration has been already alluded to. It was announced before the first adjournment of the new parliament, on the elections to which they had built their firmest hopes. Public opinion will, possibly, be long divided on the merits of the financial scheme, announced by Lord Henry Petty, during the last session of his chancellorship of the exchequer—a scheme, by which that minister promised, that upon the data which he laid down, it would not be necessary to increase the public burthens beyond a trifling amount, during the ensuing period of 20 years. It was, however, necessary from this flattering conclusion to suppose, that the national expenditure should not exceed, during that period, the sum of 38 millions yearly; a supposition so improbable, as to dispel the fairest hopes attached to his system.†

There are proofs of the merit of this short adminis-

* Before the news of the recapture of Buenos Ayres had reached Lord Grenville's ministry, they had dispatched a considerable reinforcement of troops, who, under the gallant conduct of Sir Samuel Achmuty, had taken Monte Video by storm.

† The plan of Lord Henry Petty was adapted to meet a scale of expenditure nearly equal to that of the year 1806; and it assumed, that, during the war, the annual produce of the permanent and temporary revenues, would continue equal to the produce of the same year 1806. It was understood, that any further or unforeseen change, or any deficiency of revenue, should be separately and specifically provided for. Keeping these premises in view, it was proposed that the war loans, for the years 1807, 1808, and 1809, should be twelve millions annually; for the year 1810, 14 millions; and for each of the ten following years, 16 millions annually. These several loans, amounting for the 14 years to 210 millions, were to be made a charge on the war-taxes, which were estimated to produce 10 millions annually. The charge, thus thrown on the war-taxes, was meant to be at the rate of 10 per cent. on each loan. Every such loan would, therefore, pledge so much of the war-taxes, as would be sufficient to meet this loan: That is, a loan of 12 millions would pledge 1,200,000*l.* of the war-taxes. And in each year, if the war should be continued, a further portion of the war-taxes would, in the same manner, be pledged. Consequently, at the end of 14 years, if the war should last so long, 21 millions, the whole produce of the war-taxes, would be pledged for the total of the loans, which at that time would have amounted to 210 millions. The 10 per cent. charge thus accompanying each loan, would be applied to pay the interest of the loan, and to form a sinking fund, which sinking fund would evidently be more than five per cent. on such of the several loans as should be obtained at a less rate of interest than five per cent.

A five per cent. sinking fund, accumulating at compound interest, will redeem any sum of capital debt in 14 years. Consequently the several portions of the war-taxes proposed to be pledged for the several loans above mentioned, would have redeemed their respective loans, and be successively liberated in periods of 14 years, from the date of each such loan. The portions of war-taxes thus liberated, might, if the war were prolonged, become applicable in a revolving series, and might be again pledged for new loans. It was, however, shewn, by the printed calculations, that whatever might be the operation of the continuance, the property tax would not be payable beyond the period for which it was granted, by the 46th George III. ch. 65, but would in every case be in force only during the war, and until the 6th of April, after the ratification of a definitive treaty of peace.

The charge for the interest and sinking fund of the proposed loans being taken from the annual produce of the war-taxes, a deficiency equal to that charge would be created in the amount of the temporary revenue, applicable to the war expenditure. Supplementary loans would be required to make good that deficiency. Those supplementary loans would increase, in proportion to the increasing deficiency, if the war should be continued; but the whole amount of the loan in any one year, including that charged upon the war-taxes, and the supplementary loan, would never, even in a period of 20 years from the present time, exceed 500,000*l.* in any year, beyond the amount to which the combined sinking fund of that year would have been raised; and, upon an average of those 20 years, would not

tration which appeal to moral feeling, and are infinitely less obscure than those depending on financial calculation. They lent a cordial, and happily a triumphant assistance, to the abolition of the slave trade; they obtained a vote of the House of Commons against the granting of places or payments in reversion; thus taking from the crown the power of dilapidating its own resources, and from the people one source of the corruption of their leaders. They delivered from slavery (that is, from service for life,) the soldier, hitherto the only slave in a free country; and when they retired from office, *magnis ceciderunt ausis*. They were dismissed, because they would not promise to cease being the advocates for the religious toleration of millions of their fellow subjects. The intention of moving a bill for permitting Catholics and other dissenters to be eligible to any situation in the army and navy, had been announced by Lord Howick in the Commons, and had been submitted to his majesty by his ministers, and had met with his approbation. Some doubts, however, as to the extent of the measure, were entertained by some members of the cabinet, who at last objected to the bill in the strongest terms. His majesty was soon after apprised, that the concession to the Catholics was of greater extent than he had conceived it to be, and he conveyed to Lord Grenville his disapprobation of the bill. Ministers then endeavoured to modify the bill, so as to reconcile it to his majesty's wishes, without destroying its vital essence. Failing in this attempt, they determined to drop it altogether; but at the same time, to insert in the proceedings of the cabinet, a minute, reserving to Lord Grenville and Lord Howick, first, the liberty of delivering their opinions in favour of the Catholic question; secondly, that of submitting this question, or any subject connected with it, from time to time, according to circumstances to his majesty's decision. Far from these terms being granted, ministers were called upon, not only to withdraw the latter reservation, but to substitute in its place a written obligation, pledging themselves never again to bring forward any thing connected with the Catholic question. These terms having been declined, his majesty informed them, that he must look out for other ministers. A new administration was immediately formed. The Duke of Portland was appointed first lord of the treasury; Mr Percival, chancellor of the exchequer; Lord Eldon, lord chancellor; Lord Liverpool, secretary for the home department; Lord Castlereagh for the war department; Mr Canning, minister for foreign affairs; Lord Mulgrave, first lord of the admiralty.

exceed 3,800,000*l*. It was proposed that the supplementary loans should be formed on the established system of a sinking fund, of 1 per cent. on the nominal capital. The charge so created, was to be provided for, during the first three years, by the expiring annuities, and during that period the country would have the great benefit of an exemption from all additional burthens. From 1810, and for the six following years, a charge was to be provided for, amounting on the average of those seven years to not more than 293,000*l*. annually; a sum in itself so small, in comparison with the great additions which have necessarily been made to the taxes in each year for the last fourteen years, that it would scarcely be felt, and could not create any difficulty as to the means of providing for it.

Provision was thus made on the scale of actual expenditure for ten years of war, if it should be necessary, without any additional taxes, except to an inconsiderable amount. At the close of that period, taking the 3 per cents at 60, and reducing the whole of the public debts at that rate to a money capital, the combined amount of the public debts would be 387,360,000*l*. and the combined amount of the several sinking funds 22,720,000*l*.; whereas, the then amount of the whole public debt, taken on the same scale of calculation, was 352,793,000*l*. and the amount of the sinking fund no more than 8,353,000*l*.

If the war should be continued beyond the ten years thus provided for, it was proposed to take, in aid of the public burthens, certain excesses to accrue from the present sinking fund. That fund, with the very large additions derived to it from this new plan, would amount, in 1817, to 24 millions sterling. But it was now proposed, in any case, to apply to the charge of new loans, a larger portion of the sinking fund than such as would always leave an amount of sinking fund equal to the interest, payable on such part of the present debt as should remain unreduced. Nor was it meant that this, or any other operation of finance, should ever prevent the redemption of a sum equal to the present debt, in as short a period as that in which it would have been redeemed, if this new plan had not been brought forward.

After the battle of Friedland, Sweden remained alone faithful to her alliance with Britain; Russia had even, before that event, given several symptoms of secession, particularly in the appointment of Count Romanzow as her minister for foreign affairs, a man notoriously hostile to the English interests. Denmark affected a neutrality, which, in reality, she was not only unable, but unwilling to maintain. The greatest fear of her cabinet was for her German territory. Thus the victories of Bonaparte brought the French near her: she had not courage to collect her troops in the face of that power; but in 1805, when the coalition was formed against France, she openly threw what little influence she then possessed, into the scale of that country, and collected an army, which contemptible as it was, could only be meant to watch the motions of Prussia, while the French soldiers were fighting on the banks of the Danube. France, the tyrant of the continent, was her natural enemy; but her weakness had made her willing to bend so entirely to the views of that power, that she had become willing to suffer from Britain, an enemy created by the influence of France, deeper injuries than France had yet inflicted. In the spirit of submission to France, she had solicited our government to be excused from receiving our packet boats at the ports of Holstein or Sleswig, and this was brought forward as a plan of amicable arrangement with us. Our government repelled the proposal, and the Danes forbore to press it, being yet unprepared to come to a rupture. But the bare proposal shewed a degradation of national independence, from which we had a right to conclude that the basest acquiescences to France would yet arise, when she should be obliged to break with us. Such was the situation of the north of Europe, when, even before the signing of the peace of Tilsit, it was known that Bonaparte was likely to accomplish, as the first fruits of his conquests, the formation of a maritime confederacy against Britain. The result was, a determination, on the part of the British government, to send a powerful military and naval force, amounting to 20,000 soldiers, and 27 sail of the line, to strike a blow upon Copenhagen.

The command of the military was given to Lord Cathcart; and Admiral Gambier commanded the fleet. To conduct the negotiation, his majesty's ministers selected Mr Jackson, who had for several years resided at the court of Berlin. Upon the ground of Bonaparte's design to shut the ports of Holstein against the British flag, and forcibly to employ the Danish navy against this country, Mr Jackson was instructed to repair to the re-

sidence of the Prince Royal of Denmark, and to call upon his royal highness for an unequivocal declaration of the intentions of Denmark, and for an infallible pledge of the execution of those intentions, if they were not hostile to Great Britain. This pledge was the delivery of the Danish fleet into the possession of the British admiral, under the most solemn stipulation, that it should be restored at the conclusion of the war between this country and France. Should this be refused, and should the British negotiator have in vain exhausted every argument and effort to obtain the prince royal's consent to it, as the foundation of a treaty of alliance and general co-operation between the two countries, he was directed to announce, that it would be enforced by the British armament assembled in the Sound. In presenting this alternative, every possible stipulation was to be advanced, by which the present and future interests of the crown of Denmark were to be fostered by the resources of the British empire. Permanent alliance; guarantee, and even aggrandisement, of their actual possessions; every thing was promised that the fleets, and armies, and the treasury of England could afford.

Mr Jackson left England on the 1st of August, and arrived on the 6th at Kiel. In case impediments should be thrown in the way of his communication with the British mission at Copenhagen, or with the British commanders, a period was fixed, beyond which the latter was not to wait, to hear from Mr Jackson, but to suppose that a constraint had been put upon his person, and to proceed in the execution of their instructions. On the day after his arrival, Mr Jackson announced the purport of his instructions to Count Bernstorff, and applied for an audience of the Prince Royal. The Danish minister is said to have received the proposals with the warmest indignation. The prince remained calm and unaffected during a long interview with Mr Jackson, and rejected the proposals with a dignified but determined declaration, that Denmark would adhere to the neutrality she had hitherto observed. Next day Mr Jackson was informed, that the prince had set off for Copenhagen, but that any proposals which he might make in the name of the British court, should be forwarded to his royal highness. The British minister chose rather to follow the prince to his capital, and arrived there on the 12th of August. In the mean time, from the prompt movements of the British squadron, no progress had been made in assembling an army in Zealand. A division of our fleet, under the immediate direction of Commodore Keats, had been detached to the Great Belt, with instructions to allow no military force to pass over from the continent. That officer had led his line of battle ships through an intricate and ill-known navigation, without the smallest loss, and stationed his vessels within telegraphic distance of each other. All connection was thus intercepted between the island of Zealand and the adjacent isle of Funen, and the mainland of Holstein, Sleswig, and Jutland. A levy had been made in Copenhagen from amongst the populace; but without the walls of that city and of Elsinore, there was not a battalion of regular troops. On reaching the Danish capital, Mr Jackson was informed at the first interview with the minister, that the prince had returned to Sleswig. This conduct was thought to shew a studied disposition to avoid negotiation, and the acknowledgment of the Danish minister, that he had no authority in the prince royal's absence to conclude any arrangement in the least compatible with Mr Jackson's instructions, determined the British envoy

to take his leave. He repaired that same evening on board the advanced frigate of the British squadron, now at anchor within a few miles of Copenhagen. Next morning the British commanders were informed, that all hope of accommodation was at an end.

The army accordingly landed without opposition at the village of Vedbeck, on the morning of the 16th of August, and, after some ineffectual attempts of the enemy to annoy its left wing by the fire of their gun-boats, and to impede its progress by sallies, which were always repulsed with loss, it closely invested the town on the land side. The fleet coming to a nearer anchorage, formed an impenetrable blockade by sea. On the evening of the 2d of September, the land-troops, and the bomb and mortar vessels, opened a tremendous fire upon the town, with such effect, that a general conflagration soon was visible. The fire was returned but feebly from the ramparts of the town, and from the citadel and crown batteries. On the night of the third, the British fire was considerably slackened, either from apprehension that the ammunition would not suffice for the prosecution of the siege, or, what is more probable and charitable to believe, from hopes being entertained that the impression already made would produce proposals for capitulation. It was probably because the Danes adopted the first of these suppositions, that the second was not realized; the besieged conceived some hope from the relaxation of our fire, which, however, was resumed with so much vigour and effect, that on the night of the 4th, (September), a trumpeter appeared at the British out-posts, with a letter from the commandant of the town, proposing a truce for twenty-four hours, to negotiate a capitulation. The capitulation was not signed till three days after, when the British army took possession of the citadel, dock-yards, and batteries, dependent upon them. The British admiral immediately began rigging and fitting out the ships that filled the spacious basons, and were there laid up in ordinary. These, at the expiration of the term limited by the capitulation, were, together with the stores, timber, and every other article of naval equipment found in the arsenals, conveyed to England, where, with the exception of one ship of the line, that was stranded or destroyed on the island of Huen, they all arrived safely in the end of October.

The natural humanity of the British public, excited by the horrible details of this siege, gave a popular aid to the outcry of the opponents of government at this proceeding. Ministers, too, in their own defence, were anxious to impress the public with a belief that specific information of the intentions of Denmark to throw herself into the scale of France, or, more properly speaking, to submit to her, had been received from their foreign agents. It was even pretended, that Denmark had been forced to be a secret party to the treaty of Tilsit, although it was afterwards proved that the date of our resolution against Copenhagen had been long anterior to any communications that could be made respecting the treaty of Tilsit. The most tenable grounds of defence which ministers exhibited, were, first, the general probability of Denmark being unable or unwilling to make a last stand against France; and, secondly, the express overtures which had been made to the Prince Regent of Portugal, and which he had communicated to the British ministry. In these, the adherence of Denmark to the French interests was announced, both as the means and the motive for obtaining that of Portugal. It has been stated with confidence, that the Danish minis-

himself admitted the impossibility of defending Holstein, Sleswig, and Jutland, from French invasion. The only doubt that remains, is, what the Danish court, driven to the solitary possession of Zealand, would have done? Whether they would have stood, with passive heroism, faithful to alliance with us, as their defenders, or purchased their political, though still dependent existence, by submission to the power who could still give them much, and *take every thing except Zealand and their fleet?* We think the weight of probability lies heavily against such an hypothesis.

But the system on which the Danish war was commenced, if justifiable, was not improved to the extent of which it was capable; and the abandonment of the island of Zealand, left the acquisition of the object which would have best justified the expedition, to the mercy of a French army, as soon as the Danes should have a fleet worth seizing.

The treaty of Tilsit was hardly concluded, when Bonaparte turned his eyes towards the west of Europe, and resolved on the subjugation of Portugal and Spain. He demanded of the court of Lisbon, to shut up the ports of Portugal against England; to detain all Englishmen residing in that country; to confiscate all English property; denouncing war in case of refusal: And, without waiting for an answer, he gave orders for detaining all Portuguese merchant ships that were in the ports of France. The Prince Regent of Portugal, hoping to ward off the storm, acceded to the shutting up of his ports; but refused to comply with the two other demands, as being contrary to the law of nations, and to the treaties that subsisted between the two countries. The court of Portugal then began to adopt measures for securing its retreat to the Portuguese dominions in South America. For that purpose, the Prince Regent ordered all ships of war fit to keep the sea to be fitted out; and also gave warning of what was intended to the English, directing them to sell their property, and to leave Portugal, in order thus to avoid an effusion of blood, which, in all probability, would have proved useless. He resolved also to comply, if possible, with the views of the French Emperor, in case he should not be softened to more moderate terms. But Bonaparte peremptorily insisted, not only on the shutting up of the ports, but on the imprisonment of all British subjects, the confiscation of their property, and a dereliction of the project of retiring to America. The Prince Regent, when he had reason to believe that all the English not naturalized in the country had taken their departure from Portugal, and that all English property had been sold, adopted the resolution of shutting his ports against England, and even of complying with the other demands of France: Declaring, however, at the same time, that should the French troops enter Portugal, he was resolved to remove the seat of government to Brazil, the most important and best defended part of his dominions.

It had been frequently stated to the cabinet of Lisbon, by the English ambassador Lord Strangford, that his Britannic majesty, in agreeing not to resent the exclusion of British commerce from the ports of Portugal, had gone to the utmost extent of forbearance; that, in making this concession to the peculiar circumstances of the prince regent's situation, his majesty had done all that friendship could justly require, and that a single step beyond this line of modified hostility must lead to the extremity of actual war. Nevertheless the prince regent, in the fond hope of preserving Portugal by conciliating

France, on the 8th of November signed an order for detaining the few British subjects, and of the very inconsiderable portion of British property that yet remained in Lisbon. On the publication of this order, Lord Strangford removed the arms of England from the gates of his residence; demanded his passports; presented a final remonstrance against the recent conduct of the court of Lisbon; and retired to a British squadron, commanded by Sir Sidney Smith, who immediately established a most rigorous blockade at the mouth of the Tagus. A few days after, the intercourse between the court of Lisbon and the British ambassador was renewed. Lord Strangford, under due assurance of protection and security, proceeded to Lisbon on the 27th, when he found the prince regent wisely directing all his apprehensions to a French army which had entered Portugal, and was on its march to Lisbon, and all his hopes to an English fleet. The object of this march he was at no loss to understand; for Bonaparte had declared in his journals, that the house of Braganza had ceased to reign. Lord Strangford promised to the prince regent, on the faith of his sovereign, that the British squadron before the Tagus should be employed to protect his retreat from Lisbon, and his voyage to the Brazils.

On the morning of November 29th, the Portuguese fleet set sail from the Tagus, with the Prince of Brazil and the whole of the royal family of Braganza on board, together with many of his faithful counsellors and adherents, and other persons attached to his fortunes. The fleet consisted of eight sail of the line, with frigates, brigs, and Brazil ships, in all amounting to 36 sail. While they passed through the British squadron, our ships fired a salute of 21 guns, which was returned with an equal number. The friendly meeting of the two fleets, at a juncture so critical and important, was a sight exceedingly interesting and affecting. Four English ships of the line were sent by the British admiral to accompany the royal family to Brazil. After Portugal had fallen under the dominion of France, the valuable island of Madeira was committed to the protection of British troops.

A new parliament assembled on the 22d of June 1807. Their debates during the summer were comparatively uninteresting; but when the second session was opened, the late expedition to Copenhagen, and our relations with America, furnished momentous subjects of discussion. Of these, the subject of the orders in council might be regarded as the most practically important; for, whatever might be said of the Copenhagen expedition, the deed was done; and the human misery it had occasioned, could not be repaired, even had the advice suggested by Lord Sidmouth been adopted, for fixing a time for the restoration of the capture—a proposal which was triumphantly rejected by ministers. But the measures with regard to America were still open to recal.

In November 1806, Bonaparte had issued at Berlin his famous decree, in which he declared the British islands to be in a state of blockade. He also shut the ports of all the countries under his authority against all vessels which had last cleared from Great Britain, and subjected to confiscation all cargoes of British produce or manufacture. In aid of this regulation, he afterwards declared that all neutral vessels coming into any port of his dominion, should bring with them what was called a certificate of origin; being an assurance under the hand of the French consul at the port of shipment, that the cargo was not of British produce or manufacture, and

that all vessels which should be met at sea without such a certificate, should be liable to capture. This Berlin decree, which, from the impotence of France to enforce it in its most material points, ought to have been regarded as an insulting bravado, was very properly resented on the part of the Grenville ministry, by a mild decree, which interdicted the coasting trade of the enemy.

Ten months elapsed without any other measure of commercial hostility from either cabinet, till November 1807 (a year after the publication of the Berlin decree) appeared our new orders in council, by the Portland ministry, containing these two substantial propositions: *First*, That France, and all its tributary states, should be held to be in a state of blockade; and that all vessels should be seized which attempted to trade from any neutral port to those countries, or from them to any neutral port. *Secondly*, That all vessels should be liable to seizure, which should have on board any such certificate of origin as was required by the Berlin decree. Neutral vessels intended for a French or hostile port, were directed at all events to touch first at Great Britain, from which, after paying certain duties, they may in some cases be allowed to proceed; and in all cases they are permitted, and indeed enjoined, to come to Great Britain when clearing out with a cargo from any port of the enemy.

America, from her sole enjoyment of independence, was deeply interested in the operation of these contending decrees, which placed her trade between two fires. But the interests of Britain were no less involved in this measure than those of America, and her trade to that quarter of the world began to suffer severely. The American merchants remonstrated against the orders, and petitioned parliament to rescind them. Their cause was pleaded at the bar of the house by an able lawyer, (Mr Brougham,) who did ample justice to their cause. The petitioners declared, that the obvious tendency of the orders in council was to annihilate our neutral commerce; and that it actually had reduced our American trade to one third of its former extent. The preamble to the orders in council had justified the measure, by declaring that the decrees of France had exhibited an unprecedented system of warfare, (for, independent of such provocation, our right to exercise such hostility towards neutrals, was not pleaded by the strongest advocates of the orders). It had been also stated, in the same preamble, that neutrals had acquiesced in these decrees of France, and submitted to them as part of the new system of war. It was proved, however, that the French decrees were not unprecedented. In 1739, in 1756, under the old government of France, and at three subsequent periods since the French revolution, decrees had been issued by the enemy for capturing all vessels laden even in part with British produce, and yet they had not been followed by any such measure of retaliation on the part of Britain. With regard to the Berlin decree, it was not true that it had either been enforced by France, or that America had acquiesced in it. General Armstrong, the American ambassador, so far from acquiescing in the Berlin decree, had applied, to learn whether it was intended to be enforced against American vessels: and it was answered by the French government, that the blockading decree was not intended to be enforced against the ships of that nation. From distinct evidence laid before the House of Commons, it was proved that neutral vessels had been publicly and regularly chartered on voyages from this country to the Con-

VOL. IV. PART II.

tinent of Europe after the Berlin decree, in the same manner as before it; that the prices of articles of colonial produce and home manufactures, continued the same in the continental markets after the Berlin decree down to the orders in council; that the greatest merchants in the neutral trade had never heard of a neutral vessel being condemned in the hostile ports; and that the rate of insurance of such vessels had not been raised by the Berlin decree, but only by the orders in council. In defence of the policy of the orders, it was argued, that we should reduce the enemy by distress to abandon his system of blockade, and to permit the free ingress of our colonial produce and manufactures. The continent, it was said, would not calmly submit to such privations as the want of tea, sugar, tobacco, cotton, and foreign medicines. Bonaparte would at last be compelled, by the murmurs of fifty millions of human beings, languishing for luxuries to which they had been habituated, to abandon his excluding system. It is strange to observe, that at the moment when ministers were pleading for this probability, they were avowedly encouraging the smuggling trade between Britain and France; a trade which, as far as it could succeed, exactly supplied the enemy with those luxuries, for the loss of which we expected the continent to mutiny against its tyrant.

In opening the budget of 1808, the chancellor of the exchequer stated the supplies which had been voted to be 48,653,170*l.*, from which was to be deducted the proportion furnished by Ireland, viz. 5,713,601*l.*, which would leave a sum to be defrayed by Britain of 42,939,569*l.* The ways and means amounted to 43,076,000*l.* The loan for England and Ireland was ten millions and a half, of which eight were for the use of this country. The whole sum was to be funded in the 4 per cents, and the contractors for every 100*l.* advanced to the public were to receive 118 : 3 : 6, so that the public paid, for every 100*l.* capital, 4 : 14 : 6½ interest. In consequence of the loan of ten millions and a half, there was a capital of debt created to the amount of 12,408,375*l.*, from which, after deducting a proportion of two seventeenths for Ireland, making 2,954,375*l.*, there would remain as a permanent burthen upon Great Britain 9,454,000*l.*, and an annual charge for interest of 475,536*l.*

Among the changes in military arrangement produced by the new ministry, was that of substituting a local militia for the unregimented levy of 200,000 men from the whole population, which the late ministry had determined on calling out and training to arms. This local militia was to be balloted for in the different counties, in proportion to the deficiency of volunteers in each, between 18 and 31 years of age; nor were exemptions to be made but at a very high fine. The officers were to possess the same requisites as to property as those of the existing militia, except in one instance, namely, that whoever had held the rank of a field officer in the army might hold the same rank in the militia, without such qualification. Volunteer corps might, if they chose, transfer themselves, with the approbation of his majesty, into this local militia. The period of service during the year was to be 28 days, exclusive of the days for assembling, marching, &c. for which pay was to be allowed. The expense was calculated not to exceed the present volunteer establishment. It would not exceed four pounds per man for the year. Having a regimental force of 400,000 men, in addition to the regular army of 200,000, which might, if occa-

4 P

sion required, be augmented to 250,000, the empire might be considered as secure.

Beaten and overawed by the armies of France, the Emperor Alexander sought refuge from the disgrace of submitting to Bonaparte, in affecting to be his cordial ally; and pretending to have changed his whole opinion of the true interests of Europe, joined with his recent conqueror in a plan for its partition. Almost immediately after the capture of Copenhagen, he declared war against England; complaining that she had harassed the Russian trade; that she had refused his proffered mediation for a peace with France; that in the late war against France, a war instigated by herself, she had promoted only her own selfish ends, and had sent out expeditions to Naples, Buenos Ayres, Sicily, and Egypt; finally, that she had seized upon the Danish fleet. Austria and Prussia were also obliged to declare war against English commerce, though they had the decency not to accompany their declaration with a complaining manifesto.

The treaty of Tilsit was hardly concluded, when Bonaparte turned his views to the West, and resolved on the subjugation of Portugal and Spain. Perhaps it was his first design not to overthrow the thrones of these kingdoms, but, under the veil of alliance and union, to reduce them to the same abject dependence as the confederations of the Rhine, Holland, and Switzerland. With this view he had called the flower of the Spanish troops to serve in his late sanguinary campaigns in Germany and Poland. Through his ambassador, Beauharnois, at the court of Madrid, he fomented discord in the royal family of Spain, that he might assume to himself the arbitration of their differences. The French ambassador suggested to Ferdinand, Prince of Asturias, the idea of intermarrying with a princess related to the Emperor Napoleon. The anxiety of the prince of Asturias to avoid an union with another lady, selected for him by his greatest enemies at court, induced him to acquiesce in the proposition of Beauharnois, with the reservation, that it was to meet with the approbation of his royal parents; and he wrote a letter, signifying his wishes to the French emperor. This clandestine communication, and other circumstances artfully prepared, gave colour to an accusation insidiously prepared against the innocent prince. A few days after he wrote the letter to Beauharnois, he was arrested and confined in the monastery of St Lawrence. On the 31st of October, all the members of the different councils of state being assembled, a declaration by the king was read to them, stating a discovery that the prince of Asturias had formed a conspiracy for dethroning his father. He had been surprised, it was said, in his own apartments, with the cyphers of his correspondence, which were laid before the council of Castile, with instructions for them to investigate the whole matter. The whole Spanish nation instantly suspected, that the pretended conspiracy was an infamous calumny, fabricated by Godoy, the Prince of Peace, and Bonaparte, for the purpose of removing the only obstacle which then opposed their designs. The imprisonment of the Prince of Asturias, and the decree against his person, produced an effect quite contrary to the expectations of the favourite Godoy, who now receded in fear, and pretended to moderate a reconciliation between the royal parents and their son. He dictated penitential letters from Ferdinand to both the king and the queen, and made the Prince of Asturias sign them while a prisoner. There is nothing in these

confessions of a very heinous nature; and they may all be fairly supposed to allude to the step which Ferdinand had taken, in writing to Napoleon without the king's knowledge on the subject of his marriage. But a decree, which had been addressed to all the clergy, ordaining a solemn thanksgiving to God for the king's deliverance, was meant to preserve the idea, that the prince had harboured designs against his father's government, if not against his life. On the 5th of November, a royal edict was addressed to the governor *ad interim* of the council of Castile, declaring that the voice of nature having disarmed the hand of vengeance, the king had been moved by pity, and the intercession of the queen, to pardon his penitent son, who had given information against the authors of the parricidal design.

Such was the state of affairs, when a French courier arrived at the royal palace of St Lawrence, with a treaty concluded and signed at Fontainebleau, on the 27th of October, by Isquierido, the plenipotentiary of his Catholic majesty, and Martial Duroc, in the name of the French emperor. By this treaty it was agreed, among other articles, that the province of Entre Minho y Duero should be made over in entire property and sovereignty to the king of Etruria, with the title of king of Northern Lusitania. The province of Alentejo and the kingdom of the Algarves, in entire property and sovereignty to the Prince of Peace, to be by him enjoyed under the title of Prince of the Algarves. The provinces of Beira tras los Montes, and Portuguese Estremadura, were to remain undisposed of till there should be a general peace. The kingdom of northern Lusitania, and the principality of the Algarves, were to acknowledge, as their protector, his Catholic majesty the king of Spain, and in no case were to make peace or war without his consent. In case of the provinces of Beira and Portuguese Estremadura devolving at a general peace to the house of Braganza, in exchange for Gibraltar, Trinidad, and other colonies which the British had conquered from Spain and her allies, the new sovereign of these provinces was to contract, with respect to his Catholic majesty, the same obligations as the king of Northern Lusitania, and to hold his territories on the same conditions. The king of Etruria ceded that kingdom in full property and sovereignty to the emperor of the French and the king of Italy. By a secret convention, it was agreed that French troops were to be admitted into Spain, where they were to be joined by bodies of Spanish troops, and marched into Portugal. Another body of French troops, to the number of 40,000, were to be assembled at Bayonne before the end of November, to be ready to enter Spain in case the English should send reinforcements to Portugal.

The French forces which had assembled on the borders of Spain, remained but a short time inactive. Early in 1808, a corps entered Catalonia, and on the 16th of February obtained possession of the town and citadel of Barcelona, and of the strong position of Monjuich. As a slight pretence for these movements, it was said that the French were marching to assist in repelling the insults of the British army on the Spanish coast; and rumours were whispered of an intended invasion of Algiers and Morocco. At Monjuich and Pampeluna, some slight resistance was made by the national troops. There seemed however, to be no organ of the general will; and although the Spanish troops were rapidly advancing from Portugal to Madrid, yet the feeble court who directed them, were every day issuing contradictory

orders. The people, however, were at last alarmed, and roused from torpor. It was rumoured that the king was preparing to leave Aranjuez for Seville, with a view to emigrate to his American dominions. The character of the Prince of Peace made it highly probable that he would instigate the royal family to such a resolution, as he possessed immense riches, and foreseeing the impending storm, might well be anxious to withdraw. It was rumoured, with equal probability, that the Prince of Asturias was sufficiently attached to his country to oppose the design. A popular commotion broke out at Aranjuez. The palace of the Prince of Peace was attacked; and though he saved himself by flight, their majesties found it necessary to appease the public indignation, by proclaiming that Godoy, their favourite, was discharged from his high offices and commands, and was permitted to retire wherever he might choose. The people of Madrid, whither Godoy had fled from Aranjuez, were determined that he should not retire with such impunity. They rose like the people of Aranjuez, discovered the Prince of Peace in a garret, and committed him to a common jail. In the midst of these commotions, Charles IV. published at Aranjuez, on the 19th of March, a formal abdication of the Spanish throne; either impelled by personal fears, he gave way to the popular wishes in favour of his son, or was terrified into the measure by Bonaparte, who, for the sake of getting the favourite of the people, the Prince of Asturias, into his power, soon after invited him to a fatal interview, under the new title of Ferdinand VII.

The first act of the new king was to publish a manifesto and demonstration of his own innocence. He confiscated the effects of the Prince of Peace, and appointed to the presidency of the grand council of Castile, a popular nobleman, the Duke of Infantado, who was known to be attached to the English interests. On the 23d of March, he made his public entry into Madrid. Two days before that time, the French army under the Duke of Berg, had also entered the Spanish capital. While the governor and garrison of Madrid submitted to the degrading act of being obliged to welcome an enemy's army come to overawe them, the mass of the people were in a state of high fermentation, and some mortal encounters took place between the individuals of the two nations. Hitherto the occupation of the country by the French had been endured, on the part of the Spaniards, more from stupefaction than cowardice. But when they saw the French General Duhesme throwing ammunition and provisions into Barcelona, they remonstrated against the portentous movement.—“Your troops,” said the Spanish Captain-general Espetella, in a letter to the French general, “that occupied the citadel and the fortress of Monjuich, might have considered all the houses of Barcelona as so many magazines, and the provisions they contained as their own. Your excellency occupied the fortresses in the name of the emperor and king as an ally; and it was only on the faith of this, that the Spanish government consented to its occupancy. The city gave you an honourable reception, and shared with you the provisions destined for her own use.” A fresh insult was, however, offered to the Spaniards, when the Prince of Peace, whose imprisonment had occasioned the utmost joy throughout the kingdom, was liberated by the imperative orders of Bonaparte. It had been intended to bring him to trial, but the intercession of the old queen with the French emperor, obtained the release of her guilty favourite,

who instantly repaired to Bayonne. But though the Duke of Berg possessed Madrid with a large army, while Ferdinand, the idol of the people, remained in his capital, it was impossible to execute the plans which the French meditated. It became, therefore, the grand object of Bonaparte's ambassadors and emissaries, to persuade the new king to leave the spot on which they durst not arrest him. General Savary arrived as a new envoy from Paris, he announced the intention of the French emperor to visit Madrid, and suggested the propriety of the Spanish monarch paying him the compliment of meeting him on his own frontiers. Ferdinand unhappily fell into the snare: he was decoyed under the pretence of procuring the favour of Bonaparte, by a friendly meeting, to proceed from Madrid to Burgos, from thence to Vittoria, and finally to Bayonne, where he found himself in a short time in the hands of Bonaparte, like another Montezuma in the power of Cortes. Together with the released Prince of Peace, Charles IV. and his queen arrived also at Bayonne. Bonaparte had found it easy to force and persuade the aged royal pair to leave their native dominions, after they found an escape to America impracticable; nor had the Spaniards to regret that they had lost an imbecile sovereign, and a queen who was still more unpopular, from her connections with the Prince of Peace.

Having got so many members of the royal family into his possession, Bonaparte immediately threw off the mask, and in a direct message to Ferdinand the Seventh, required of him, and all his family, to renounce the crown of Spain and the Indies. Charles, his queen, and the Prince of Peace, were easy instruments in the tyrant's hands; and Charles immediately declaring that his former resignation had been forced upon him by the fear of popular tumult, reclaimed his right to the sceptre, that he might transfer it to the Emperor of France. Ferdinand, though now a prisoner, would not however resign his right to the throne, except on certain conditions, calculated to prevent the alienation of the kingdom to any foreign power. He proposed that Charles should return to Madrid, whither he would attend him as a dutiful son; that the cortes, or at least the great council, should be assembled; that Charles should dismiss from his presence the detested Prince of Peace; and, in case of the aged king resigning the burthen of government, should transfer it to none but himself. These negotiations had lasted for some time, and Ferdinand still continued resolute, when a memorable conference took place, (on the 5th of May,) at which the Emperor of the French, the old king and queen of Spain, the Infant Don Carlos, Godoy Prince of Peace, some grandees of Spain, and the Spanish minister, Don Pedro Cevallos, were present. Ferdinand was, after some time, called in to it by his father. The queen, in a transport of passion, addressed him as a traitor, who had for years meditated the death of the king; but proclaimed her own infamy, by adding, “I tell you to your face, that you are my son, but not the son of the king.” She was proceeding in her reproaches, when Napoleon interrupted her, by saying, “I give to Ferdinand the crown of Naples, to Don Carlos that of Etruria, with one of my nieces in marriage to each of them; let them declare if they be willing to accept this offer.” After a short silence, Don Carlos replied, “Emperor, I am not born to be a king, but an infant of Spain.” Ferdinand was silent. Bonaparte, after a short pause, resumed: “Prince, you must choose be-

tween cession or death." Six hours were allowed to him for coming to a determination. King Charles seconded the threat of the emperor against him and all his followers, and Ferdinand, humanely anxious not to involve the lives of a number of persons comprehended in the threat, made the resignation that was commanded. He was immediately deprived of his coach of state and sword of honour, watched by a party of the militia, and allowed no attendant but the commander of the guard.

Charles the Fourth ceded to Napoleon all his rights to the throne of the Indies, stipulating (if such a transaction could be coupled with the name of stipulation,) that the integrity of the kingdom should be maintained, its religion upheld, and its sovereign, whoever he should be, independent.

The intelligence of this transaction excited a tremendous convulsion at Madrid. On the day fixed for the departure of the king of Etruria, of the daughter of king Charles, and her son Don Francisco, for Bayonne, where they were summoned by Bonaparte, the people surrounded the palace to which they were bidding adieu. The carriages were indeed suffered to depart, but the indignation and pity of the people were wound to the highest pitch, by beholding the tears of the Infant Don Francisco. While their emotion was at the highest, a detachment of French soldiers arrived, and immediately a scene of carnage commenced. It is not fully ascertained whether the populace or the French were the first aggressors, but the latter were the first who had recourse to fire arms; and, at the discharge of these, the common people seized on every species of weapons that could be found.

The Frenchmen employed in this dreadful day in Madrid did not exceed 10,000. They succeeded at last in quelling the inhabitants, after a terrible slaughter in the morning, which was changed into a regular military execution in the afternoon. The Spanish troops had no share in the contest, having been confined to their barracks by their officers. If they had joined their countrymen, there can be no doubt but that every Frenchman in Madrid might have been exterminated; but the retaliation would have been equally dreadful, for besides the 10,000 in Madrid, there were 50,000 in the immediate neighbourhood, who would have, in their turn, taken vengeance on the inhabitants.

By a royal edict dated at Bayonne, (May 4th,) the Grand duke of Berg, whom Charles in the edict called his cousin, was appointed lieutenant-general, or viceroy, of all Spain. Before the courage of the kingdom was yet fairly displayed, it seemed as if it were necessary to discharge, in a few disgraceful events, some of the baser spirit which yet remained. The Junta at Madrid disarmed all the citizens of the capital, and even anticipated the edict of Bayonne, for making the duke of Berg their president. The council of Castile also sanctioned by their name, and published the edicts, of Bonaparte and his viceroy; and the Inquisition, true to its old disgraceful principles, addressed a circular to the people, inviting them to submit to the paramount power.

Bonaparte supported these addresses, by declaring to the Spaniards, that he was determined to make them what they had once been,—a great, glorious, and happy nation. "Your princes, (he said,) have ceded to me their rights to the crown of the Spains; your nation is old—my mission is to restore its youth." This address

was followed by a decree for summoning a junta of Notables to represent the Spanish nation at Bayonne, there to fix the forms of a new government. To constitute this assembly, he named about 150 individuals of different classes and conditions, but only about 90 were convened. The junta at Bayonne held their twelfth meeting on the 17th of July, on the day appointed for the acceptance of the new constitution. In the chamber where they sat, were erected a magnificent throne, and a richly decorated altar, the service of which was performed by the Archbishop of Burgos. Joseph Bonaparte, to whom Napoleon had transferred the crown of Spain, addressed the junta as their king, and was answered in a speech from the president, after which the oath of allegiance was administered to several members, and the junta attended his levee. We have heard of the high spirit and independence of the Bayonne junta, as presenting the first obstacle to Bonaparte's ambition, but there is no symptom of any such spirit in these transactions.

King Joseph set foot on the territory of Spain on the 9th of July 1808, and made his public entry into Madrid on the 20th, attended by the members of the Bayonne junta. He had a personal guard of ten thousand Italians and other troops, independent of an army of eighteen thousand men, under General Bessieres, who were posted at Madrid for his defence. To Spain it was still more humiliating than the entry of an usurper into her capital, to see, in the list of that usurper's officers of the household, the names of some of her noblest grandees, and even the names of men bearing the character of patriotism, who had struggled against the Prince of Peace, and laboured to get the Prince of Asturias on the throne. Don Louis Mariano de Urquijo, was made his secretary of state; Don Pedro Cevallos, minister for foreign relations; the duke of Park, the duke of St Germain, the duke of Infantado, the Count Santa Collona, and the dukes of Ossuna and Sotomayor, were his captains or chamberlains. It was not until the mass of the people (the populace itself) had set an example of patriotism to those men, that any of them redeemed their honour, by apostatising from the usurper. But though courtiers and courtly patriots could brook the degradation of the Spanish name—though some of the nobility, from mean despair, and others from still meaner hopes, acquiesced in the change of dynasty, the people were agitated by nobler passions. Though the flower of their regular army was serving abroad; their north eastern frontier in the hands of French garrisons; their metropolis, their interior, and the neighbouring kingdom of Portugal, possessed by 100,000 veteran Frenchmen, commanded by the best officers in Europe; without arms, ammunition, or treasury, and deserted by their own government, they rose to combat with the masters of Europe—with the tactics of Bonaparte himself. It is true, that in many instances the conduct of the Spaniards has not been consistent with this bold commencement; but, under such circumstances, to have risen even for a moment with unanimity, exhibits a picture unparalleled in modern history. The motto of the insurgents was, "*The Spanish blood shed at Madrid cries for vengeance.*"

The public mind had been strongly agitated ever since the massacre of Madrid; but it was not till the abdication of Ferdinand was announced, that a general explosion burst forth. The anniversary of the tutelary

saint of the prince, St Ferdinand, awoke all the sensibility of an ardent, devout, and loyal people. On that day, (the 27th of May,) the insurrection commenced in many places. In Valentia, Don Miquel de Saavedra, captain general of the province, was put to death for opposing the insurgents. At Cuença, Carthagena, Malaga, and Granada, and in the Castiles, and Estremadura, the same scenes were exhibited. At Cadiz, when it was known that the patriots had corresponded with the English at Gibraltar, Solano, the lieutenant-general of Andalusia, who headed the French faction, came post haste to the city, and thundered forth proclamations against their designs; but the people, conducted by Spanish officers, rose and surrounded his palace, and put him to death, in the act of proclaiming his attachment to Napoleon. These unconnected efforts were quickly brought into unity by the establishment of provincial juntas.

The lead in the affairs of the patriots was taken by the supreme junta of Seville, which, with a happy audacity, assumed, and, for a time, exercised all the functions of sovereign authority. Laying hold of some statutes in their constitution, which authorised their rejecting the orders of the supreme council of Madrid, when the capital should be in the hands of foreign troops, they proclaimed Ferdinand the VII. and war against France. This pre-eminence which they claimed in authority, was due to them from the circumstances of Andalusia. That was the province in which there were most veteran native troops, the only foundry of cannon in the kingdom, and the greatest store of arms and ammunition. It is the province, too, in which Gibraltar is situated, and which could best receive assistance from England. It is the province of opulence and resources. Although it was not among the highest ranks that the patriotic ardour was strongest, many of the dignified clergy and nobility joined the general enrolment of the people. The bishop of St Andero appeared among the patriots, and the Count de Montejo was indefatigable in enlisting and drilling the volunteers. The monasteries and the universities poured forth recruits. The standards of the latter bore the names of saints; those of the former wore the names of Greek or Roman heroes. By an agreement between the Spanish general Castanos and the patriots of Cadiz, on the one part, and of the British officers at Gibraltar and in the Mediterranean, on the other, Lord Collingwood arrived with ships to take the command of the English fleet off Cadiz, and general Spencer, with six or seven regiments, from Gibraltar. Lord Collingwood offered his services for the reduction of the French fleet in the harbour; but Thomas de Morla, who succeeded to the government of the city after the execution of Solano, determined that this should be exclusively an achievement of the Spaniards. The French ships lay in the canal of the arsenal, in such a position, that they were out of the reach of the cannon of the castles, as well as of the Spanish squadron off Cadiz; but the gun-boats, bomb-vessels, and batteries, constructed on the isle of Leon, and near fort Louis, soon reduced admiral Rosilly (June 14th,) to surrender the fleet, consisting of five ships of the line of 74 guns, one frigate, and four thousand seamen and marines.

Advice having been received, that a detachment of French had assembled at Tavira, to enter Spain from the side of Portugal, by the river Guadiana, general Spencer, with his detachment, set sail for the Guadiana, and landed his troops at Ayamonte. Three ships had already been sent to the mouth of the Guadiana by general Purvis. Alarmed at these movements, the French concentrated all their force at Lisbon, excepting a few detachments in fortified places. The Portuguese also rose upon their oppressors, and sent solicitations for succours to admiral Sir C. Cotton, who commanded the naval forces of Britain in that quarter. The change of circumstances, which had thus changed the relations of Spain and Great Britain towards each other, hardly needed the ceremony of a proclamation, to establish friendship and alliance. The juntas, however, formally proclaimed peace and alliance with Great Britain, Sweden, and Portugal; and the Portuguese provinces of Algarve and Alentejo put themselves under the protection of the junta of Seville; so did the Canary isles. Envoys were dispatched to the transmarine establishments of Spain, in the Americas, West Indies, and Asia, inviting them to the cause of the patriots, and of Ferdinand. Proclamations had been sent out to those colonies by king Joseph; but the vessels which carried them had been mostly taken by the English, and the crews of those which arrived had been imprisoned by the transatlantic patriots. Meanwhile the Viscount de Materosa, Don Diego de la Vega, and other deputies from the Spanish and Portuguese provinces, arrived at London. Peace was proclaimed with Spain in the London Gazette, on the 6th of July. The Spanish prisoners in our jails, to the number of many thousands, were liberated, clothed, and sent home to join their countrymen in arms. Independent of the arms and treasures promptly forwarded by government, the public ardour in Britain, for the cause of the patriots, was evinced by subscriptions that were set on foot throughout the kingdom; and some corps of militia volunteered their services in the cause.

Some admirable precautions were published by the Seville junta, calculated to direct the desultory warfare which they had determined to pursue, in preference to risking pitched battles. Happy had it been if the several juntas, in their zeal to animate their countrymen, had not forgot the precaution of adhering to truth, in the calculation of their fighting men. While they hoped to terrify the French by exaggeration, they only deceived each other, and their allies.* Of the French armies in the whole peninsula, including the army of Junot in Portugal, a force exceeding 100,000 men; 50,000 were stationed in Madrid, or its vicinity, under Prince Murat, and marshal Moncey. From this great body, detachments were sent to take possession of Cadiz and Valentia; the former detachment commanded by Dupont, the latter under marshal Moncey. Marshal Bessieres had in charge to guard the roads between Madrid and Bayonne, and to bridle the country as much as possible, by spreading to the right and left.† This northern army was opposed by the Spanish general Cuesta, at the head of the forces of Galicia, Asturias, Estremadura, and Leon, and those of some insurgent districts of Biscay. General Castanos was commander in chief of the four kingdoms of Andalusia, with the provinces of Granada and Valen-

* This was sadly experienced by Sir John Moore.

† Of the 14 provinces of Spain, there were four in the hands of the French when the insurrection broke out, Navarre, Biscay, and the two Castiles. The fortress of Barcelona was also in their possession.

tia, which had united themselves with Andalusia. Admiral Cisneros was captain-general of Murcia. Don Joseph Palafox of Arragon; and Count Espetella of Catalonia.

The army of Dupont left Madrid 20,000 strong, crossed the mountains of the Morena, and descending into Andalusia, took and pillaged Cordova. At this place, the French general was informed that Castanos was advancing with 45,000 patriots. He retired first to a strong position behind the Guadalquivir, and from thence fell back to Baylen. Already he had lost great numbers by the desultory attacks of the insurgents. It was not, however, till a whole division of his army under general Wedel, and a reinforcement under general Belliard, which were on their march from Madrid, had been separated from him by the judicious movements of Castanos, that his case became hopeless. As his last resource, he made a bold attack on 25,000 of Castanos' army,* with all the forces under his immediate command, was repulsed with the loss of 3000 men, and obliged to surrender at discretion. General Wedel's division was comprehended in the capitulation. It was agreed, that they should be sent home by sea. The battle of Baylen was fought on the 20th of July. General Moncey was not more successful in Valentia. Marching upon the city of Valentia, after routing the peasants at the passes of the mountains, he began to cannonade its walls, when he was attacked by general Caro, the nephew of Romana, with the covering army, was beaten back to his camp, and from thence obliged to fly to Madrid. Of 15,000 men who had marched with Moncey from the Spanish capital, 1500 were taken prisoners, and 10,000 returned, with a prodigious proportion of wounded. In the campaign of Arragon, the defence of Saragossa displayed a heroism never surpassed in ancient or modern times. On the 14th of June, before any force could be organized for the protection of this defenceless city, 9000 French, under the orders of general Le Febvre, took up a position on the heights which command Saragossa. A small party of cavalry even penetrated into the town; but they paid dearly for their rash advance, being cut off to a man. The Saragossians had hastily planted some cannon before the gates of their city, and also in some favourable positions without the town; when, on the 15th of June, the French sent a detachment against these out-posts, while their main body attempted to storm the city at one of their gates. The Saragossians resisted both attacks with successful fury. They closed with the French after single discharges, and overpowered them. A party of the enemy that entered the town were cut to pieces, and Le Febvre retired beyond the reach of their cannon, losing, in his retreat, 400 cavalry, and 27 baggage waggons. This was but the prelude to a more dreadful siege. The French receiving reinforcements of troops and artillery, had again nearly invested the town before the expiration of June, and reoccupied the adjacent heights. During their advance, the Saragossians employed their slender means of defence to the best advantage. They tore down the curtains from their windows, and formed them into sacks, which they filled with sand, and piled up before every gate in the form of a battery, digging round each of them a deep trench. The gates of Saragossa are, in many places, connected by the mud walls of gardens within the town, in others by buildings, or by the

remains of an old Moorish wall, which had not even a platform for musquetry. Through these intermediate houses, and mud walls, the brave citizens broke holes for musquetry and cannon. The houses in the environs of the city were pulled down or burnt. Gardens and olive grounds were cheerfully rooted up by the proprietors, whenever they impeded the defence of the city, or covered the approach of the enemy. The exertions of the men were imitated by the women, and even the children.

The heroism of the citizens was only equalled by their industry, and by the sagacity of those who conducted the defence. Gunpowder was manufactured within the walls of the city, though it was on fire in every quarter. At the end of nearly two months, every desperate effort had failed to recover the adjacent heights and the environs: the bodies, but not the courage, of the besieged were almost exhausted. On the 4th of August, the French opened a tremendous fire on one quarter of the town: the mud walls had been battered down: the French columns had entered, and were in possession of one-half of the city, even to the central street. The French general then demanded a capitulation, in these words,—“*Head quarters, Santa Engracia: The Capitulation.*” He was answered in the following words: “*Head quarters, Saragossa: War to the knife.*” The French occupied one side of the main street called Corso. The Arragonese threw up their entrenchments within a few paces of them, on the opposite side. In day light, it was certain death to appear within this horrid interval; but during the night, the combatants often dashed across the street against each others batteries. At last the ammunition of the Spaniards began to fail, and the people were calling out to be led to attack the enemy with only their knives, when, at this awful crisis, a convoy of provisions and ammunition, and 3000 Spanish guards, Swiss and volunteers of Arragon, unexpectedly found their way into the city, under Don Francis Palafox, the brother of the general. A council of war now determined, that if the whole of Saragossa should be consumed, the patriots should retire over the Ebro to the suburbs, and defend them till they perished. The people shouted when they heard the resolution. For eleven days the conflict was continued from house to house, from room to room, when the French had again lost all but about an eighth part of the city. During the night of the 13th of August, the fire of the French was particularly destructive; and, when their batteries ceased, flames were seen to burst out in many parts of the buildings in their possession. On the morning of the 14th, to the great surprise of the Saragossians, the enemy's columns were seen at a distance retreating over the plain, on the road to Pampeluna.

In Catalonia, the French general Duhesme had been directed to reduce Gerona, at the same time that Le Febvre was sent against Saragossa; but, after spending a month in the siege, he was threatened by the insurgents in flank, and precipitately retreated. The French prevented (but with the utmost difficulty) the patriots from cutting off the communications of Figueras, and investing Barcelona. Such were the successes of the patriots in the south and east; while their affairs in the north of Spain wore a much less favourable aspect, from the fate of a battle which they lost at Medina del Rio Seco, in the province of Leon. Marshal Bessieres,

* Of these, one half were irregulars.

while he dispatched a force against Saragossa, had also pushed forward columns against Segovia, Logrono, Valladolid, and St Andero. Segovia was taken, after the defeat and dispersion of the peasantry before its walls. The town and province of Palencia was also disarmed, and the members of the council of the captured towns were deputed to go to Bayonne, there to supplicate the forgiveness of Joseph Bonaparte, and swear fealty to his *Catholic majesty*. General Merle had proceeded to the mountains of St Andero on the 21st of June, and defeated the natives under their patriotic bishop in one quarter, while General Ducos drove them from post to post into the town from other points. The French generals then entered St Andero on different sides: the peasants returned to their homes; and the city swore fealty to the usurper. But the severest blow to the patriotic cause, was the defeat of the army of the western provinces under Cuesta. That general, whose forces comprehended all the prisoners restored by the British government,* was attacked (on the 14th of July) on the high grounds of Medina del Rio Seco by general Bessieres. All the positions of his raw troops were carried. He lost all his artillery, his baggage, stores, and the better part of his army. The Spaniards fled through Benevento as far as Astorga. They were pursued for many days; and all the places which they left behind them surrendered as the enemy came up.

It appears, however, that in spite of this defeat, the patriots were not without hopes of rallying even under Cuesta, and that reinforcements were expected to join the fugitives from Medina. The battle of that place was certainly not regarded as a sufficient counterbalance to the surrender of Dupont at Baylen, and the symptoms of a resisting spirit which were still displayed. When the news of the battle of Baylen had reached Madrid, the French immediately had begun to fortify the Reteiro. On the evening of the 29th of July, they began to evacuate Madrid. King Joseph, with the last companies of the troops, left the Spanish capital on the 29th, from whence he proceeded to Burgos, after plundering the public treasury of the plate and the crown jewels of his unfortunate predecessors. It was observed by the Spaniards, "that Joseph had put the crown into his pocket, which he durst not wear upon his head."

While the French government could not extinguish the flame of insurrection in Spain, they were still less able to prevent its explosion being heard all over Europe. Bonaparte had in vain attempted to impress the Spanish regiments, in that army which he kept watching over his late conquests in Germany, with an idea, that

the most respectable part of their countrymen had sanctioned his proceedings. He published, indeed, an account in the *Moniteur*, of those regiments having voluntarily come forward to devote themselves to his cause, and, having formed a detachment, to beg the honour of being the body-guard of Joseph. If any such offer was made, it ill accorded with the subsequent spirit of the same troops, who, when they heard of the true state of their country, planted their colours in the centre of a circle, around which they formed, and, having sworn an oath of patriotism on their knees, marched out through the hostile battalions which surrounded them, but who did not choose to put their courage and despair to the proof. Ten thousand Spaniards, stationed under the Marquis Romana on the island of Langland, Zealand, and Jutland, who had thus emancipated themselves from the French yoke, were brought off by our fleet in the Baltic under Admiral Keats, and were conveyed, with their stores, arms, and artillery, to Corunna, on the 30th of September.†

The whole aspect of Spanish affairs, had inspired hopes in the beginning of summer, that the co-operation of a British army would not be thrown away in the Peninsula; and for this purpose, a force of about 10,000 men set sail from Cork on the 12th of July, and arrived at Corunna on the 20th. Sir Arthur Wellesley, who commanded them, offered the assistance of his forces to the Junta of Galicia; they replied, that they wanted not men, but arms, ammunition, and money, but recommended a diversion by the British in Lisbon. The army then sailed for Oporto, but was left inactive there, while Sir Arthur proceeded in person to have a conference with the British admiral, Sir Charles Cotton, off Lisbon. On board of that admiral's ship, he received information from General Spencer, that the Junta of Seville did not require the co-operation of his little army; he therefore gave orders to General Spencer to join him, in his proposed operations on Portugal. Before he landed his troops, he received advice from home, that 5000 men, under General Anstruther, were proceeding to join him, and that 10,000 men, under Sir John Moore, would speedily be detached for the same purpose.

This last commander had been sent, in the month of May, to assist our forlorn ally, the King of Sweden, against a combined attack from Russia, France, and Denmark. His army reached Gottenburg on the 17th of May, but was not permitted to land. Sir John Moore repaired to Stockholm, to communicate his orders, and to concert measures for the security of Sweden. He

* Cuesta's army, by the French account, amounted to 35,000; by that of the Spaniards, to less than 16,000. The French army were at least 22,000 strong, and had a large force of cavalry.

† The common account which is given of the first communication of the state of his country to the Marquis of Romana, is, that a Swedish clergyman, in the disguise of a low and travelling tradesman, arrived at the head quarters of the Marquis, and addressed him in the streets, at first under the pretence of offering him some smuggled coffee for sale, but afterwards found means to intimate the object of his errand, by speaking in Latin. The writer of this article does not presume to contradict the whole story of the Swedish clergyman, but can affirm, from his own knowledge, that a person, who is not a Swedish, but a Scotch Roman Catholic clergyman, (his name is Robertson,) received 1000*l.* from the British government for communicating the message of our cabinet to the Marquis of Romana, at his head quarters in Germany. Mr. Robertson had been hired to do so; and proceeded to the continent, at the risk of his life, availing himself of a German education, which made him easily pass for a native merchant. He found much less difficulty than the Swedish agent is represented to have met with. He found Romana, not surrounded by spies and watches, but accessible in his own hotel, where Robertson took up his lodgings, and had a conversation with him the day after his arrival. Romana was, indeed, at first very cautious, and would not believe that the other was an empowered agent, till Robertson proved, that he must have been informed by a British minister lately resident in Spain, of circumstances known only to the marquis and the minister. Robertson asked Romana, if he remembered having dined with Mr. ——— in Spain on a certain day, and their having looked over certain books and pictures after dinner. He reminded him also of certain remarks that had been made; which Romana recollected. The Marquis then had no doubt of Mr. Robertson's having been sent by the British government; but committed himself no farther in conversation, than by saying, that he should consult the other officers of the Spanish troops upon the subject.—The writer of this article received the above statement from the Scottish clergyman's own mouth, and knows that he received the reward already mentioned.

there found, to his surprise, that though the Swedish army was quite insufficient for defensive purposes, his Majesty's thoughts were intent on conquest. It was first proposed that the British should remain in their ships, till some Swedish regiments should be collected at Gottenburg, and that the combined forces should land and conquer Zealand. Upon an examination of the plan, it was found that the island of Zealand, besides its fortresses, contained a regular force, superior to any that could be brought to bear against it, and that the adjacent islands were full of French troops, which could not be prevented from crossing over to it in small parties. It was next proposed, that the British alone should land in Finland, storm a fortress, and take possession of the province. But General Moore justly represented, that 10,000 British troops were insufficient to encounter the principal force of the Russian Empire, which could quickly be brought from Petersburg. The Swedish monarch is said to have haughtily told Sir John Moore, that he would command him to undertake any enterprize which he might think proper. Sir John Moore asked, by what authority he should do so. "By authority from your own sovereign," replied Gustavus. Sir John begged to be shewn the document; a reply which was felt by the monarch as an implied doubt of his royal word; and for daring to disbelieve a false assertion, he ordered the British commander to be put under arrest. Sir John escaped, however, from Stockholm in disguise, and, conformably to his instructions, brought back his troops to England.

Strengthened by the assurances of speedy reinforcements, Sir Arthur Wellesley determined to disembark in Mondego Bay, a situation in which he could be supported by a Portuguese army, which had advanced to Coimbra. On the 9th of August, the advanced guard marched forward on the road to Lisbon, and on the 15th had a slight action with the French at Obidos. Next day they halted, and on the day after an attack was made upon a large force of the enemy, under General Laborde, at Roleia. Their force amounted to 6000 men; but there was some reason to believe, that it would be joined by another body of equal force, under General Loison, who had gone to quell an insurrection in the south of Portugal, but was expected to return in the course of the night. The French were defeated, but retreated in good order. By this success the road was cleared to Lisbon. On the day after this affair, the British army moved to Lourinha, to facilitate the junction, and protect the landing of the troops under General Anstruther, after which they resumed their march. But Junot was determined to attack the British army before its reinforcements should arrive. Leaving Lisbon with the greater part of his forces, he came up with Sir Arthur Wellesley on the 21st of August, and attacked him in his position at Vimeira. The French renewed their onset in different columns, with the utmost impetuosity. They were repulsed at all points, after repeated charges with the bayonet, and at last retreated with the loss of about 3000 in killed, wounded, and prisoners, leaving behind them 13 pieces of cannon and 23 ammunition waggons. After the dispositions for the battle of Vimeira had been made, and the action already commenced, Sir Henry Burrard, who was superior in command to Sir Arthur Wellesley, arrived at the scene of action; but declined to deprive Sir Arthur of the honour of obtaining a victory, which appeared so probable.

On the 22d, Sir Hew Dalrymple, the lieutenant go-

vernor of Gibraltar, arrived to take the command over both at Cintra, the place to which the British had moved after the battle. When intelligence was received in England, in the words of Sir A. Wellesley, that the whole of the French army in Portugal, under the command of the Duke of Abrantes in person, had sustained a signal defeat, the public hope was naturally sanguine that the victory would be followed up by important advantages. The arrival of the next dispatches was celebrated by the firing of the Park and Tower guns, at a late and unprecedented hour of the evening. With astonishment it was learnt in the morning, that this ceremony had been performed for a convention, which had been signed at Cintra, between the respective generals of the British and French armies; a convention founded on the basis of an armistice, agreed upon the day after the battle of Vimeira. It was stipulated, among other articles, that the English government should be at the expense of transporting the whole of the French army to any of the ports between Rochefort and L'Orient. When the army arrived in France, it was to be at liberty to serve again immediately, and the property of the French was to be sacred and untouched. It might either be carried off into France, or sold in Portugal. By the seventh article of the preliminary treaty, it had been even stipulated, that the Russian fleet should be allowed either to remain unmolested in the Tagus, or to return home. But this was indignantly refused by Sir Charles Cotton, our admiral off the Tagus, who obtained the surrender of the Russian ships, on condition of their being restored by his Britannic majesty, in the event of a treaty being concluded with Russia, and of Admiral Siniavian and his crews being conveyed to their own shores by our ships.

The general regret and indignation of the country at this convention of Cintra, was expressed in petitions to the throne, for an inquiry into the whole transaction. An inquiry was set on foot. The report of the military board stated, in defence of the convention, that, from the want of cavalry in the British army, it was not possible to have followed up the victory of Vimeira by an immediate and fresh blow. When the suspension of arms was agreed upon, the army under the command of Sir John Moore had not arrived, and doubts were entertained whether so large a body of men could be landed on an open and dangerous beach. The landing was indeed accomplished, but it was still doubtful whether they could be supplied with provisions from their ships, on a coast so impracticable. The convention, it was added in the report, released 4000 Spanish soldiers, and also 2000 Portuguese. The enemy, if driven to extremity, might have been joined by 6000 Russians. They were masters of the Tagus and of the strong fort of Alentejo, and might have detained our army during the remainder of the year. Our army was immediately left at liberty to march into the heart of Spain by a direct route, while the enemy, who were liberated by the convention, took a circuitous route by sea. From this approbation of the convention, however, Lord Moira made a spirited dissent, with reasons which sufficiently overpowered the fallacious arguments which have been stated. And in spite of the favourable report of the board, his majesty signified his disapprobation of the terms.

Bonaparte concealed the necessity which obliged him to recal his troops from the Oder to the Ebro, by making the withdrawing of them appear an act of favour to the Prussians, at the intercession of Russia. Having met

the Emperor Alexander with a splendid ostentation of friendship at Erfurth, he strengthened the ascendancy which he had gained over that monarch by the conferences at Tilsit, and he induced him to join him in an offer of peace to the British. As the Spaniards were denominated Insurgents, in the first reply which he made to the proposition of admitting the government of that country to an independent share in the negotiation, his Britannic majesty closed the negotiation, by a dignified declaration, that neither the honour of his majesty, nor the generosity of the British nation, would allow them to abandon a brave and loyal people, whose exertions in a cause so unquestionably just his majesty had pledged himself to maintain.

While the army of France lay inactive on the Ebro and the passes into Biscay, and while Napoleon was employed in averting danger on the side of Russia and Germany, the provincial juntas had leisure to resolve themselves into one supreme and central body. The meeting of this assembly was an imposing spectacle, but it was nothing more. Morla was but one of many traitors, who had a principal influence on all its proceedings. Jealous of their generals, they gave them no power, but kept them at the head of separate armies, each independent of the other. They misled themselves, and deceived the people into a fatal security, by pompous proclamations, and absolute falsehoods as to the state of the national resources. They took no pains to recruit the armies with arms and clothing. In short, during the interval that the French were weak, they did nothing either to overpower them before they were reinforced, or to meet them with equal numbers. The whole army of the patriots now, including the army of Romana, and the regiments delivered from the hulks of Junot, were divided into three wings. The eastern, commanded by Don Joseph Palafox; the north-western by General Blake; the central by Castanos. The army of Castanos and Palafox, mustering 11,000 men, while the junta proclaimed that it was 70,000 strong, is described by a British officer,* who saw it, as a mob of miserable peasants, without organization, and with few officers that deserved the name. The general and principal officers had no confidence in the men, nor the men in themselves. The army of Blake, even after the accession of Romana's corps of 8000, could not amount to 17,000 when it fought the French: it also was lamentably deficient in officers, food, and clothing, and in every species of warlike equipment.†

Bonaparte having ordered a levy of 160,000 conscripts, set troops in motion for Spain, and followed them from Paris, without waiting to hear the last reply of the British to his proposals for a negotiation. On the 12th of November he joined his brother Joseph with a reinforcement of 12,000 men. Agreeably to the plan of the campaign chalked out by the junta, Castanos crossed the Ebro at three points, and suffering himself to be decoyed by the French, pushed on as far as Pampeluna. When it was seen that he had completely fallen into the snare, Marshal Ney crossed the Ebro, routed the Spanish divisions at Logrono and Colabora, and completely separated him from communication with Blake. In a series of actions from the end of October, General Blake's army was driven from post to post as far as Es-

pinosa. There they made a stand; but were obliged to recommence their retreat. During the conflict at Espinosa, a French detachment was sent against the last retreat of the Gallicians at Reynosa. The patriots were routed and dispersed. Blake, with his shattered remains, took refuge in Asturias. What remained of the corps of Romana, which had formed part of the Gallician army, fled first to St Andero, and afterwards to Asturias. Marshal Soult pursued them closely, and entered St Andero. In the mean time, the Estremaduran army under the command of the young Count Belvedere, was decoyed like Castanos's to pass the Ebro. Advancing rashly to Burgos, they were there almost annihilated. The enemy having thus destroyed the two armies of the north and of Estremadura, fell upon Castanos at Tudela, and defeated him in an engagement, which fixed the fate of the campaign. The battle of Burgos had broken the centre of the enemy; the battle of Espinosa the right; that of Tudela crushed their force upon the left; and the road to Madrid was laid open. Before these fatal dispersals, Sir John Moore had commenced his march from Portugal to support the Spanish armies. Galicia, or the borders of Leon were fixed upon by our war minister as the place for assembling our troops; and it was communicated to General Moore, that 15,000 men had been ordered to sail for Corunna. For the junction of these with his own forces, he was directed to send such orders as he should think proper to Sir David Baird, who commanded them. A distressing dilemma presented itself at the outset of Sir John Moore's army on their march. Of the two great roads through Portugal into Spain, viz. the northerly road to Almeida, or the great eastern road to Elvas, it was found that the latter was through a country which would not furnish sustenance to the army; and the former was too mountainous to admit the carriage of artillery.‡ It was therefore necessary to divide the army. Six thousand men were entrusted to General Hope, who marched by the Elvas or Madrid road: The rest moved by Coimbra, Abrantes, and Almeida. The Spanish government had recommended Burgos as the point of union for the British troops; and Madrid and Valladolid were the places appointed for magazines. It was communicated by government to General Moore, through Lord William Bentinck, that he would find between 60,000 and 70,000 men assembled under Blake and Romana in the Asturias and Galicia; independent of Castanos's force on the front and left flank of the enemy. A more complete reverse of every thing which the imagination of Englishmen had painted of Spanish affairs could not be found, than in the real state of Spain.

In his progress, Sir John Moore found the constituted authorities reluctant to afford him support: a reluctance which continued, either from treachery or sluggishness, throughout the whole of his campaign. To increase his embarrassments, Lord Castlereagh, after dispatching an inadequate supply of money, wrote to the general, that silver was not to be found in England, and that he must expect no more for some months. Before he arrived at Salamanca, he learned, that the Spaniards had been defeated at Burgos. At Salamanca, he learned that the French had advanced to Valladolid, within twenty leagues of him. Thus, instead of finding,

* Captain Whittingham, in his letter to Lord William Bentinck.

† From Captain Carrol's dispatches, quoted in the Narrative of Sir John Moore's Campaign.

‡ This was found to be an error, occasioned by the ignorance of the Portuguese respecting the state of their own country.

as he had been taught to expect, his entry into Spain covered by 60,000 Spaniards, he found the enemy within three marches of him, and not a Spanish picquet in his front. He saw, also, that the advance of the French had produced no sensation in the country. The people were all tranquil, and employed about their ordinary occupations, knowing and caring little about public matters. Four days after his coming to Salamanca, the British general received the news of Blake's total defeat, in a letter from Mr Stuart, our resident at Madrid, who described the imbecility of the Spanish junta, and justly inferred from it, that there was room for the most desponding views. The accounts of the other armies already stated, prepared him to hear of the most disastrous events. In the mean time, Sir David Baird had arrived at Corunna (October 13). In his march from that place, an alarm, communicated to him by Blake, that the French were penetrating by Rio Seco, made him prepare to retreat back to Corunna; but the alarm was discovered by Sir John Moore to be false, and he received orders to continue his advance. Every day, however, brought intelligence of new disasters, and more clearly disclosed the dangers of the British army in front. Yet was it, at this time, that General Moore received from Mr Frere, our ambassador at Madrid, the most pressing solicitations to advance, and push forward to the Spanish capital under any circumstances. This was also the opinion of the traitor Morla, who recommended that he should hasten with a part of his army, if he could not bring forward the whole of it. But the intelligence of Castanos' defeat, and the utter dispersion of all Spanish force in the north, made it doubtful whether he might be able to effect a junction with either Sir David Baird, or with General Hope, who commanded that division of his army which had come from Portugal by a different route, and which had not yet joined him. Even the united army was totally inadequate to meet the French. The general therefore determined to retreat deliberately to Portugal; to order Sir David Baird back to Corunna; and to join General Hope.

A large reinforcement of more than 30,000 French were, to Sir John Moore's certain knowledge, on their march through Biscay, which, independent of other sources of reinforcement, could be instantly augmented from the victorious army which had routed Castanos at Tudela. The whole force destined to act under General Moore, did not exceed 28,000, now divided into three bodies, whose rejunction was endangered by the advance of the main body, and whose continued strength, even after a junction, was utterly unfit to turn the scale against at least an hundred and fifty thousand disciplined French, driving the remnants of Spanish armies before them. Mr Frere, however, had arrived at Madrid with fresh instructions from the British cabinet. He was not empowered, it is true, to dictate orders to Sir John Moore; but the general was directed by the British minister to receive requisitions or representations from Mr Frere, or from the Spanish government, upon all occasions, with the utmost deference and respect: if a Spanish commander in chief was appointed, Sir John Moore was to obey him *implicitly*. Already Sir John Moore had discovered what was to be expected from Spanish co-operation. He knew that there was no Spanish army to support him, only Romana, who was assembling the fugitives of Blake's army in Leon. He had distinctly stated, nearly a month before, that four

times his force would be numbered and beaten, unless the mass of the Spanish people could resist the enemy themselves. He saw that there was no energy in their government; and whatever accounts had reached England of the general enthusiasm of the nation, he saw no appearance of it in the provinces which were now to be the scene of action.

Mr Frere, however, had brought from England those exaggerated ideas of Spanish armies and Spanish success, which the false statements of the juntas had first inspired. He described the delays and difficulties likely to attend the reinforcements of the French; he informed Sir John Moore of a Spanish army 20,000 strong in New Castile, on which Castanos was falling back; he exhorted him to advance to Madrid; and added, this step, he was convinced, would be approved of by the British government; whilst he ventured even to menace the general with the indignation of his country and government, if he refused to adopt his frantic scheme of *devoting* the British army to the defence of Madrid. A second communication reached the general, together with two Spanish generals, whom the junta had sent to exhort him to march to Madrid. They declared, that the Spanish general St Juan had fortified the passes to Madrid against the French, with 20,000 men. General Graham, however, arrived with intelligence that St Juan's corps had been utterly routed. General Moore still persevered in his resolution to retreat, until the 5th of December, when the strong representations of the junta; the resolution which he was told the people of Madrid had adopted of defending the capital to the last; the reported weakness of the French; and the duty which he conceived his country exacted from him, of rather hazarding considerable danger, than saving his army by retreat, induced him to change his resolution. In the mean time Madrid surrendered, but it did not shake the purpose of the British commander to attempt a diversion which might favour the rallying of the discomfited Spanish armies. Having been joined by General Hope, he continued to take measures from the 5th to the 14th of December, for collecting his whole force at Valladolid for the purpose of effecting a diversion in favour of the southern patriots. He would thus have General Baird in his rear. But his troops had only proceeded a single march, when it was known that Bonaparte was advancing towards Lisbon, on the natural supposition that the British would retreat from Salamanca, and that Soult was at Saldanna with a corps of 18,000 men. The general instantly perceived an opening, of which advantage might be taken. With a view to attack Soult before he should be reinforced, he moved, not to Valladolid, but to the left, and joining General Baird, advanced rapidly to the Carrion. An affair between the advanced posts of the two armies, gave marks of the superior valour of the British cavalry, but the attack of the main body was suspended; for it was learnt that Bonaparte was recalling his troops from the road to Portugal; had left Madrid in person, with 40,000 men, to throw himself in the rear of the British; and that Soult, whose position gave him a choice of retreating, as well as a power of taking our army in flank, had been strongly reinforced. There was not a moment to be lost. Soult's army alone was superior to the British. Junot, with another corps, threatened their right flank. Bonaparte pushed on so rapidly, that the advanced guard of his cavalry passed through Tordesillas the same day that the van of the

British left Sahagun. Both French and British were moving to the same point, Benevente, which was distant from the English about 40, and from the French about 60 miles. In fine, the whole disposable force of the French army, forming an irregular crescent, was moving with rapid steps to surround the British. Bonaparte's cavalry, and part of his artillery, actually came up with the rear of the British at Benevente, but were repulsed by the skill and gallantry of Lord Paget. Bonaparte, however, although disappointed in overtaking our army at Benevente, was confident that Soult would reach Astorga in sufficient time to cut off their retreat. In this attempt Soult also was foiled, by the able dispositions of the British general, who drew off his whole forces before the enemy could come up with him. General Moore had at first entertained hopes of being able to make a stand in Galicia. Whether such a stand could have been of avail had the Spaniards given us support, is doubtful; but their total apathy left no room for the experiment. The delay of a day's march would have enabled the enemy to surround our army. Had General Moore halted at Astorga, the retreat to Corunna would have been cut off. Bonaparte formed a junction at Astorga with the army of Soult; and finding, by the retreat of the British from thence, that they could not be surrounded, he detached a large force to harass and pursue them. Three Marshals of France, with as many divisions, were commanded to follow them. Although the enemy had hitherto been frustrated in his view of surrounding the British army, yet a multitude of severe distresses were accumulating on their retreat. The weather was severe, and provisions were scanty and irregularly supplied. The inhabitants of Spain gave no aid to their persevering allies, and made no attempt to annoy or retard the enemy. Instead of this, they fled from their houses, barring their doors, and carrying off cattle, provisions, and forage; every thing that could be useful to the British, or lessen their distresses. It is a melancholy truth, which must be added, that the conduct of the British soldiers, in every thing except courage, was unworthy of their cause and character during the greater part of the retreat, and was such as to draw censure from their commander.

On arriving at Lugo, the general was anxious to make a stand; and though the force which hung on his rear was considerably superior, he wished to engage it there rather than nearer the place of his embarkation. On the 7th of January 1809, he observed the French force accumulating on his left wing, and repaired thither in person; where General Leith's brigade was skirmishing with the enemy. He came to the front of the 52d regiment, in which he had early in life carried the colours. The sight and the voice of their general so animated the men, that they rushed forward with charged bayonets, and drove back a column of the enemy, before whom they had been retiring, with considerable slaughter.

A month had now elapsed since the central junta had promised to Sir John Moore that 44,000 Spanish soldiers should be united to his army: this engagement they had apparently stampt with complete validity, by deputing a number of the junta to communicate it. Mr Frere had given authority to this mission, by deputing

Charles Stuart, Esq. the diplomatic agent, to introduce the Spanish deputy, and to present his letter from Truxillo. The month was elapsed, and not a Spanish soldier had been seen; not an effort had been made to attack the French posts when weakened by the pursuit of the whole disposable force of France after Sir John Moore.

Early in the morning of the 8th of January, the British army was marshalled in array at Lugo, and offered battle to the enemy. But Marshal Soult did not stir from his post; he had experienced sufficiently the talents of the general, and the intrepidity of the troops whom he had to engage. On the other hand, the British commander perceived that it would be equally imprudent for him to attack the stronger position of the French, or to remain longer in his own. Reinforcements were pouring in on the enemy—the country had no sustenance for our troops, and to stop was inevitably to have been surrounded by an enemy of quadruple force. On the night of the same day in which they had offered battle at Lugo, a retreat was ordered.

On the 11th of January the British reached Corunna, pursued by 70,000 Frenchmen, under the command of Bonaparte, who had a great superiority in cavalry; and in daily contact with the enemy, the army had traversed 250 miles of mountainous country, without being either beaten in their rear-guard, or thrown into confusion, or losing a single standard.*

The position of the heights farthest from Corunna, but most important for its defence, was necessarily abandoned to the enemy, from the small force of our numbers, being insufficient to cover so large an extent of ground, and a second range, of much inferior advantage, was occupied. On the 16th, the British army were drawn up in order of battle, to receive the enemy, who commenced a destructive cannonade from eleven guns planted on the heights, and five strong columns were seen advancing to attack the British. As the position of the right wing of the British was unavoidably bad, and the enemy were threatening it with their most formidable attack, Sir John Moore placed himself where his presence was most needed to animate, and his skill to direct. It was soon perceived that the French extended beyond the right flank of the British, and that their object was to turn it. In order to prevent them, half of the 4th regiment, which formed this flank, were ordered to fall back, to refuse their right, and thus make an obtuse angle with the other half. This manœuvre impeded the enemy by a flanking fire. Sir John Moore, observing his success, called out that was exactly what he wanted to be done. The general then rode up to the 52d regiment, which got over an inclosure in their front, and charged the enemy most gallantly. He exclaimed, "Well done, my 52d!" and then proceeded to the 42d, addressing them in these words, "Highlanders, remember Egypt!" The Highlanders rushed on, driving the French before them. As Captain Hardinge, who had returned from ordering up a battalion of the Guards to the left flank of the Highlanders, was speaking with the commander, a cannon ball struck the left shoulder of Sir John Moore, and beat him to the ground. So composed and unaltered was his countenance; so intently and earnestly was it fixed upon the advancing Highlanders, that for a few moments it was hoped he was only stunned by the shot; but it was soon

* Narrative of General Moore's Campaign, page 336.

discovered that he was mortally wounded, and he was carried from the field of battle.*

The attack of the French upon the right of our army, was completely repulsed; and, in their turn, the French were obliged to draw back their left flank for fear it should be turned. They then attempted the British centre and left in succession; but the centre was successively defended by artillery, and the left by its strength of situation. At five in the evening, when the light began to fail, the enemy had been repulsed in every attack. When the disparity of numbers is considered, the honour which this victory reflects on the British arms must be highly appreciated. The number of Sir John Moore's army did not exceed 15,000 (for a whole division, under General Crawford, had separated and proceeded to Vigo.) The French were stronger in numbers by 10,000 men. They had marched, it is true, as far as our army; but from the superior state of their commissariat, had suffered much less in the march. Their loss was supposed to amount to 2000 in killed or wounded; that of the British was between 700 and 800.

When the session of parliament was opened, on the 19th of January 1809, it appeared, by a recommendation in the royal speech to augment the regular army, that the design of foreign expeditions was not abandoned by ministers. The disgraceful convention of Cintra, and the ministerial conduct of the war in Spain, formed the first subjects of debate. Motions of thanks were carried to the commander Sir Arthur Wellesley, and to the officers and privates who had won the battle of Vimeira. The same thanks were voted to the victors of Corunna; and both parties in the house were emulous to express their zeal in decreeing a monument of public gratitude to the lamented Sir John Moore.

To this discussion succeeded one of very considerable interest and importance, in regard to the abuse of power at home; the person chiefly implicated being no less than a prince of the blood, his Royal Highness the Duke of York, in his capacity of commander in chief. The circumstances which led to the investigation, originated in a way not very creditable to any of the parties concerned. A discarded mistress of his Royal Highness, (Mrs Mary Ann Clarke,) conceiving she had reason to complain of the non-fulfilment of pecuniary engagements, became the willing instrument of a Col. Wardle, in disclosing corrupt and improper influence respecting the disposal of military commissions and offices during the time of her connection with his Royal Highness. The rank of the person implicated, and the pretended extent of the abuses, created an uncommon degree of interest throughout the nation; and the House of Commons, for many weeks, pursued the investigation with much perseverance and zeal. Col. Wardle, and the leading members of the opposition, supported the charges against the Duke, while Mr Percival, and the principal members of administration, endeavoured to exculpate or palliate his conduct. Much evidence was brought forward on both sides; and the result, although, considering the conduct and motives of the parties which were disclosed, it did not, in the opinion of

the house, lead to criminate the Duke, as regards a direct knowledge or participation of pecuniary advantages, or intentional corruption, yet established sufficient evidence of improper conduct, and produced three separate propositions for an address to the throne. The proposition adopted by a majority of 334 to 135, was brought forward by the Chancellor of the Exchequer, and stated the regret of the house, that his royal highness should have formed so immoral a connection, and a hope that he would, in future, imitate the bright example of virtue held out by his royal father. This proposition was adopted on the 17th of March, and, on the 20th, the Chancellor of the Exchequer communicated to the house, that his Royal Highness the Duke of York had made a voluntary resignation of his command, which had been accepted by his majesty.

The subject of reform was brought forward by Mr Curwen in the month of May, who moved for leave to bring in a bill for securing the independence and purity of parliament, by preventing the obtaining seats by improper means, and also to extend the laws respecting bribery. Leave to bring in the bill was unanimously granted. Mr Curwen proposed to attach the severest penalties to the purchase and sale of seats, and superadding the oath of the representative, with respect to the mode of his introduction into parliament, accompanied by the usual guards against perjury. While the ministerial antagonists of reform, struck by the irresistible power of facts which this motion elicited, and weakened by many concessions which they had themselves made, both as to the existence of venality, and the necessity for putting some check to it, succeeded in breaking the force of the bill by amendments. An open and unqualified opponent of reform, Mr Windham, resisted the motion, not on its peculiar features or enactments, but upon its whole scope, essence, and principles. The measure, Mr Windham averred, was ill timed, injudicious, founded upon false facts, false views, and false assumptions, calculated to produce no good in the first instance, and liable and likely to lead to the most serious mischiefs in future. The House of Commons, he contended, was adequate to all the purposes of its institution; the constitution was already good; and, as there was no temptation to change its structure, so there was positive risk in trying the unknown results of visionary experiments. To prevent the sale of seats in parliament, you must take away the influence of property, and make it penal, for any one to have the power of nominating a member. So long as there are persons in a situation to say, I can make an offer of a seat in parliament, so long will there be persons to treat with for that object, and so long will means be found for committing, in some way or other, the influence so possessed, on considerations valuable to the possessor. According to Mr Windham's argument, it is equally futile, even equally unfair, to prevent the buying of seats, from a multitude, as from an individual. The influence of property cannot be got rid of. The just, wholesome, and legitimate use of property, he might be told, was a totally different thing from the sale of seats. But we

* As Sir John had repeatedly declared his wish, to a particular friend, to be buried where he had fallen, if it should be his lot to be killed in battle, it was determined to bury his body on the rampart of the citadel of Corunna. Accordingly at eight o'clock in the morning, he was deposited uncoffined. The body was never undressed, but wrapt up by the officers of his staff in a military cloak and blankets. Towards eight o'clock, next morning, some firing was heard. It was then resolved to finish the interment, lest a serious attack should be made, on which the officers would be ordered away, and not suffered to pay the last duties to their general. Some months afterwards, when the Spaniards again got possession of Corunna, the Marquis of Romana ordered the body to be taken up and properly interred in the citadel; and over the tomb a short and simple inscription was engraven.

are now arguing (said he) upon principle, which by its nature, unites things different in forms, but which are ultimately the same in substance, and does not found distinctions on accidental varieties. The influence of property is the same, whether it actually sold a seat in parliament, or gave the individual a seat to sell. The influence of property might be strained and refined, so as to retain little or nothing of its primary character, just as a certain physical impulse of our nature is refined from its original grossness into all that is delicate and sentimental,—it may branch into acts of beneficence, it becomes only the power and opportunity of virtue. But is this (he continued,) the only way in which property exerts its powers? Is it always taken in this finer form of the extract or essence? Is it never exhibited in the substance? It is here that the comparison will begin, and that the question will be asked; while the advocates of reform, who do not mean to extend it to the abolition of all influence of property, will do well to be prepared to answer, How, if the sale of a seat, or any commutation of services connected with such an object, be gross corruption, can we tolerate the influence which property gives, in biasing the minds of those who are to give their votes? How are they to suffer a landlord, for instance, to have any more influence over his own tenants, than over those of another man? How will they suffer a large manufacturer, to be able to bring to the poll more of his own workmen, than of those employed in the service of his neighbour? How will they prevent an opulent man, of any description, spending his fortune in a borough town, from being able to talk of his influence among the smaller tradesmen; or be at liberty to hint to his baker, or his butcher, that, laying out every week such a sum with them as he does, he expects that they should oblige him by giving a vote to his friend Mr Such-a-one, at the next election? "If all this," said Mr Windham, "is not corrupt, on the principles of reformers, I know not what is. What has money, spent with tradesmen, or work given to manufacturers, or farms let to tenants, to do with the independent exercise of their right, and the conscious discharge of their duty in the election of a member, to serve them in parliament? A fine idea truly, that their decision, in the choice of a representative, is to be influenced by the consideration of what is best for their separate and private interest; or, that persons, the advocates of purity, and who will hear of nothing but strict principle, should attempt to distinguish between the influence which engages a man's vote by the offer of a sum of money, and that which forbids the refusal of it, under the penalty of loss of custom, or loss of work, or of the possession of that, on which his wife and family must depend for their bread. I shall be curious to hear in what manner, not the advocates of this bill, but the advocates for the principles on which this bill is enforced, will defend themselves against these questions, and be able to shew, that, while it is gross corruption, gross moral depravity in any one who possesses such influence, to connect his own interest with the use of it, even though he should not use it improperly, it is perfectly innocent to create that influence by the means just described. Or, on the other hand, if such means are not lawful, how the influence of property is to continue such as it has at all times subsisted in practice, and been at all times considered as lawfully subsisting, it is indifferent to me which side of the alternative they take; but let them be well aware, that such is the alternative to which they will be reduced,

and that if they contend generally, as it is now done, that such and such things are corrupt, because they admit the consideration of interest, in matters which ought to be exclusively decided on principles of duty, it is in vain for them to contend hereafter, that any man has a right to influence his tenants, or tradesmen, or workmen, by any other means at least than those by which he may influence the tenants, tradesman, or workmen of any other person, that is to say, by his talents, or by his virtues, by the services which he may have done, and the gratitude he may have inspired.

When I look therefore to the moral qualities of these acts as independent of, and antecedent to, positive law, I am at a loss to find what it is, either on the score of principle or of authority, that determines them to be corrupt, or that enables us, if they are corrupt, to exempt from the same sentence of corruption, nine-tenths of the influence which has hitherto been supposed to be attached, and legitimately attached, to property; and which, for aught that at present appears, there is no intention of taking away."

This brilliant display of Mr Windham's principles, on the subject of representation, well merits notice, even in a summary view of British politics. However displeasing it may be to see venality defended on principle, yet the open manner is wholly respectable. In this eloquent passage, Mr Windham does not distract us with detail; he troubles us with no cant, no declamation, no evasion. He meets us on the ground of principle, unlike in every respect to those half conceding temporizing amenders, who frittered and pared away the bill of Mr Curwen, till it became, what a member in the house, with most rational ridicule, proposed to call it, "An act for the better securing the power of the crown in the Commons House of Parliament, by vesting in the lords commissioners of his majesty's treasury the monopoly of seats in the said house." Of Mr Windham's arguments, it may be fairly said, that they prove too much. If the influence of property be the fair source of representation; what a paradox and contradiction is our constitution, which retains even obsolete laws against bribery? If such a principle be adopted, what security shall we have if seats in parliament should be advertized in the papers for sale; if auction rooms were established for every office in the state? The argument of Mr Windham, if admitted, would prove, that no enactments, no safeguards against bribery, are to be admitted. The case may be argued on two grounds,—*principle* and *effect*, *theory* and *practice*. Now, every thing that can be called principle in the constitution,—every feeling that can be called principle in the human mind,—the law itself is at variance with direct bribery to the individual voter. But it is certainly the drift of Mr Windham's argument, because indirect, that bribery, when couched under the influence of property, can neither be wholly detected nor punished, without incurring greater evils than those which are proposed to be remedied, and that no attempt to remedy the evil should be made. It is a sufficient answer to this, that the most perfect system of representation, must tolerate a degree of indirect bribery, because it cannot interfere with actions that are not tangible or direct. The law cannot reach to tacit understandings between the landlord and his farmer, however probable it may be that the vote of the latter at an election is influenced by their mutual relation. But the law does not sanction this understanding; it only abstains from prosecuting what it cannot affect to re-

medy. But this does not prove that it should not interpose when cases are flagrant, when they overtop suspicion, and rise to clear proof. In cases of paternal authority, the law does not pretend to remedy many evils which arise from its exertion. There may be harsh fathers, and miserable children, whose cases can never come within its reach; but when the cruelty rises to a certain pitch, the abuse of that authority, like the abuse of the influence of property, is justly amenable to trial and punishment. The argument of Mr Windham is then a mere sophism, setting out on the assumption, that the principle which is to guide us in practical politics, is not that thing which distinguishes actions, but which assimilates them. This is metaphysical quibbling on the word *principle*. There is much utility to be sure, for the purpose of legal arrangement, in classing actions by their features of similarity; but when actions are to be punished or prevented, distinctions are sacredly necessary. In apportioning the punishment due to bloodshed itself, the law makes distinctions between murder and manslaughter, which, according to Mr Windham's reasoning, could never apply. The line of distinction, it is true, between the lawful and unlawful influence of property, can no more be drawn with infallible certainty, than the line of distinction between the lawful and unlawful use of the right of self defence, or between murder and manslaughter. The influence of property will always operate at elections in three ways. By the respectability which property gives to the richer candidate. That may be an innocent and even wholesome influence. It will operate also by the dependence of many of the voters for their wages or custom on the candidate or his friends. But this argument against reform is more formidable in appearance than in reality. If the laws against influence of this latter kind were enforced with vigilance in cases of notorious and open exertions, the candidate would be taught caution in holding out either threats or promises to voters; and the great mass of that part of society, whom a moderate reform would introduce as voters, are, in the present times, by no means so dependent on landlords or great masters of manufactures, as the enemies of reform hold out.

The practical evils resulting from the present system of representation are, 1st, That certain boroughs are entirely, necessarily, and perpetually at the disposal of certain families, so as to be considered as a part of their rightful property; and, 2d, That certain other boroughs are held and managed by corrupt agents and jobbers, for the express purpose of being sold for a price in ready money, either through the intervention of the treasury, or directly to the candidate. The latter use is certainly the great and crying evil. The boroughs, containing a few hundred voters, are so notoriously venal, as to have received the name of *rotten* and sometimes *treasury boroughs*, though the opposition and individuals sometimes buy them. The agent, who is generally an attorney settled in the place, obtains a complete local knowledge of the circumstances of the electors, and of the bribes, whether pecuniary, or in the shape of providing situations for the relations of such electors as are best calculated to secure a majority for any member whom it may be his interest to get appointed. He receives from the minister a sum of perhaps several thousand pounds, to secure the nomination of the intended member. The minister gets the sum from the candidate, which goes in the first instance to the procurer of

of the seat, and a part of it is by him spent in direct bribery, and other expences of election, and the surplus retained as the procurer's reward. Those electors who do not receive a bribe in money, are promised little offices for themselves or relatives in the excise, church, army, or navy. The ministers thus obtain a seat for their own creature; the electors gain either cash or provisional benefits; the constitution and the country are the only sufferers. Against the remedying of such abuses, the cry of innovation has been raised. The truth is, that these traffickings are amongst the most recent innovations of the constitution. The transference of the right of election from such places as have a few, and consequently a more corruptible body of electors, would only bring back the representation to that state in which it anciently was, before these boroughs had been partially depopulated. Mr Curwen, from some inscrutable view of the subject, consented to let the bill pass, amended by ministers, or rather annihilated as to every object which he had proposed in framing it.

The chancellor of the exchequer stated the loan necessary for making up the ways and means of the year 1809, at fourteen millions six hundred thousand pounds. The whole expenditure of the year had amounted to seventy-one millions, nine hundred and eighty-nine thousand pounds, being an increase of seven millions four hundred thousand pounds from the expenditure of the last year.

We now come to the warlike operations of the year.

In the West Indies, the success of the British arms was complete wherever they were directed. The island of Martinique was reduced in 27 days, from the departure of the expedition which sailed against it from Barbadoes. The principal place in the island which the enemy attempted to defend, was Mount Sourrier, which guarded the access to Fort Bourbon. The enemy repeatedly charged our troops; but here, as in every action where the bayonet has been employed, the superiority of the British soldier was conspicuous. The French were entrenched on the heights, and were protected by light artillery. From this strong position they were driven; and Fort Bourbon being laid open to our attack, the whole island surrendered.

In the beginning of July, general Carmichael sailed from Jamaica, for the purpose of co-operating with the Spaniards in the reduction of the city of St Domingo. At first the French general Barquier, who commanded the city, refused to surrender; but when general Carmichael made judicious and decisive preparations to carry the place by assault, the governor thought proper to capitulate.

The navy of France, unable to cope with ours in open sea, was gallantly attacked by Lord Cochrane in its own harbours. A French fleet of eight sail of the line had been blocked up in Brest harbour by Admiral Lord Gambier; but in the beginning of February, had made their escape to Basque Roads, where they were joined by four sail of the line. Here the task of attempting to destroy them, was committed to Lord Cochrane. He sailed from England in the *Imperieuse*, and Lord Gambier received orders to employ him in attacking the enemy's fleet with fireships. On the 10th of April, a number of fire vessels, and of transports, filled with Congreve's rockets, joined Lord Gambier's fleet. The filling of the chief explosion ship was committed to Lord Cochrane. He caused puncheons, placed with the ends upwards, to be filled with fifteen hundred barrels of gun-

powder. On the tops of the puncheons nearly 400 shells, with fusees, were placed, and, in the intermediate spaces, about 3000 hand grenades. The puncheons were fastened together by cables, and kept steady and immovable, by wedges and sand rammed between them. In this dreadful ship, Lord Cochrane, with one Lieutenant and four seamen, committed himself. On the evening of the eleventh of April, the fire-ships and the explosion ship proceeded with a strong northerly wind and a flood tide. When they approached the enemy, a boom was perceived, stretched across in front of the French, in order to protect their line. This was quickly broken, and the English advanced under a heavy fire from the forts, in the island of Aix.

The French fleet, dismayed and thrown into confusion, attempted to avoid destruction by cutting their cables and running on shore. Lord Cochrane approached with his explosion ships as near the enemy as possible, and perceiving that they had taken the alarm, set fire to the fusee, and betook himself with his companions to the boat. They were not able, however, to get out of the reach of danger, before the fusee exploded. Instead of having fifteen minutes, the time on which they had calculated to escape from the exploding ship, they had not left the vessel more than nine minutes before she blew up. The lieutenant, who accompanied Lord Cochrane, expired through fatigue, and two of the sailors were so nearly exhausted, that their lives were for some time despaired of. Immediately on joining his ship, Lord Cochrane proceeded to attack the French vessels that were thrown on shore, and for some time sustained their fire alone, before any other man of war entered the harbour. He made a signal to Lord Gambier that seven of the enemy's ships were on shore, and might be destroyed; but the admiral, after giving orders to moor and weigh, was obliged to anchor again, before he reached the Aix Roads, on account of the wind and tide being against him. Six of the enemy's ships, in the mean time, escaped up the river Charente; four of the remaining ships were attacked by Lord Cochrane, in the *Imperieuse*, followed by three other 74's. The result of a brilliant action, which he supported against the united ships and batteries of the enemy, was, that one of their ships of 120 guns, five of 74, and two frigates, were driven on shore, and either destroyed or rendered useless. One of 80, two of 74, and one of 50 guns, and three frigates, were burnt by our own or by the enemy's crews.

Since the peace of Tilsit, Austria had been loaded with new injuries from France, the detail of which is foreign to our history. But still, amidst threats and injuries, her government had not been idle during the favourable moment when the presence of Napoleon was required in Spain. In the spring of 1809, the Archduke Charles put himself at the head of the whole imperial army, with more extensive power than had been enjoyed by any commander since the days of Tilly and Wallenstein. On the 10th of April, the van of the Austrians crossed the Inn, and advanced into Bavaria. When information of this had reached Paris by telegraph, Bonaparte left his capital, and repaired to his head quarters at Ingolstadt. After some partial actions, which proved disastrous to the Austrians, the French emperor, discerning that the division of the Archduke Louis had imprudently separated from the main army, made a furious attack upon the Austrians at Ebensberg, and put them to the route, with the loss of 18,000 prisoners.

From thence he pushed on to Landshut, and putting the fugitives to a second route, took 9000 more prisoners. The Archduke Charles having, in the mean time, in conjunction with the Bohemian army, entered Ratisbon, and crossed to the right of the Danube, occupied the same position in which the Archduke Louis had been beaten. This movement compelled Bonaparte to leave the Isar, and return to the Danube. On the 22d of April, the French emperor arrived opposite Eckmuhl, where the four corps of the Austrian army, amounting to 110,000 men, were posted. Here a dreadful engagement took place, in which the left of the Austrians was turned; and, after their first discomfiture, they were driven, in a second attack, from Ratisbon and its neighbourhood. In the battles of Eckmuhl and Ratisbon, the French took upwards of 20,000 prisoners, and the greater part of the Austrian artillery. Bonaparte advanced upon Vienna, which surrendered after a short resistance. The Archduke Charles, after his first defeat retreated in the direction of Bohemia; but, returning towards the Danube, in the vain expectation of saving the Austrian capital, he learned, when he reached Meissau, that it had surrendered. He then moved down the northern side of the river, till on the 16th of May he fixed his head quarters at Ebersdorf. Bonaparte resolved to cross the Danube, and attack the Archduke in this position. At the distance of six miles from Vienna, he threw bridges from the southern bank to two islands in the Danube, and from thence to the northern bank; the Austrian general not disputing the passage, but allowing the French to post their right wing on the village of Essling, and their left on the village of Aspern. The Austrian commander here gave battle to the French; and by the judicious disposition of his columns, and a most extraordinary exertion of valour, the French were driven from their position on Aspern, and though the Austrians did not succeed in gaining the position of the other wing of the enemy at Essling, they completely repulsed the troops of Napoleon in the charges which they made from that quarter. The battle of Aspern began on the 21st of May, and continued, with short intermissions, for two days. During the first day's combat, the Archduke had ordered five ships to be sent down the river, and succeeded in burning two bridges, which connected the sides of the Danube across the island of Lobau, and another island of smaller size. At the close of the second day's combat, the French had been driven from Aspern, and could with difficulty maintain themselves in the village of Essling. By keeping that village, however, they covered their retreat into the island of Lobau, where they took up their position in the night between the 22d and 23d. Their loss could not be less than 30,000 men. That of the Austrians was acknowledged to be 20,000. Yet, though the victory on the side of the Archduke is indisputable, and though he took ten times more prisoners than he lost, it marks no unskilful retreat in the only pitched battle in which Bonaparte ever was beat, that he lost only 3 pieces of cannon. From the day of the battle of Aspern, to the sixth of July, the grand armies continued in sight, and even within a few hundred yards of each other; the French still possessing the island of Inderlobau, and the left shore of the river, strengthening their position and their bridges, and waiting for fresh reinforcements. The Austrians also received immense reinforcements, although their whole force could not be concentrated. The emperor Alexander, who had made common cause with his

his ally Napoleon, had dispatched an army into Poland ; and to meet the Russians, a considerable corps of the Archduke's army had been necessarily detached. The Archduke John had been also recalled from Italy ; but he was too distant to reach his brother, before the fatal day of Wagram. The Austrians entrenched themselves in the front of Essling, but unhappily neglected the same precaution of entrenching their left flank. It was to that point accordingly that Bonaparte directed his efforts. To oppose his movements, the Archduke extended his flanks, and weakened his centre. His opponent immediately marked his fault, penetrated through that part of his army, and drove it from the village of Wagram. The Austrian wings were thus thrown into confusion, and the whole army retreated, after an immense loss, towards Moravia. They were closely pursued by the French, and overtaken at Znaim, where another battle took place ; but it was shortly terminated, by the conclusion of an armistice proposed by Francis, and dictated by his conqueror. Trieste, with its territory Fiume, and the Croatian Littoral, part of Carinthia, almost all Carniola, a small part of upper Austria, with Salzburg and Berchtesgaden, and a wide territory in Galicia, were ceded by Austria to France, or to its allies, the Rhenish League and Russia. But the most humiliating article was that which obliged Francis to abandon the brave and loyal inhabitants of the Tyrol and Vorarlberg, who, in former wars, had never suffered French armies to obtain a footing in their territory, and, in this war, had driven them from their mountains, and pursued them as far as Ulm in Bavaria. Even when abandoned by Austria, these brave people fought with occasional success against General Le Febvre and a powerful French force, till the capture and death of their leader Hoffer, a man of obscure birth, and of no experience in war, but who displayed a genius and energy worthy of the greatest cause,—a man, whose memory is not tarnished but endeared by an execution infamous only to his murderers.

In turning our view to Spanish affairs during the year 1809, we find, that after the embarkation of the British army from Corunna, the arms of the French seem to have met with no material resistance except at Saragossa. The Duke del Infantado's army was chased out of Valencia, and took the route to Granada. Ferrol, before which the Duke of Dalmatia (General Soult) presented himself eleven days after the battle of Corunna, surrendered without resistance. King Joseph again made his public entry into Madrid, on the 22d of January 1809. Saragossa alone, which had before made the French fly from before its walls, made a second and most honourable defence, till the ravages of an epidemic distemper had thinned the ranks of its defenders. Palafox, who had so nobly guided the courage of the Spanish patriots, was, immediately after the surrender of the town, sent under a strong escort to France. From the time that Bonaparte left the peninsula, to organize the Austrian campaign, the operations of the French grew for some time more desultory, and less effective. The Spanish army of Cuesta, however, which, about the beginning of March, was posted on the Tagus, to oppose the entrance of the French into Portugal, was obliged to leave the passage of that river open to the French, who directed their first efforts in Portugal against Oporto. The city, though defended by 24,000 men, and 200 pieces of cannon, opposed only a feeble resistance, and the enemy proceeded against Chaves. The Portuguese general Silveira, who commanded

there, made a prudent retreat from it, and permitted the French to enter ; but he returned with reinforcements, and retook it by surprise, together with 1500 prisoners.

In the mean time, the patriots of Galicia, who had rested so perfectly neutral during the appearances of a British army among them, made a partial insurrection when it could be of least service, and, assisted by two British frigates, compelled the inhabitants of Vigo to surrender.

In the beginning of April, the principal French and Spanish armies were thus situated: The Marquis de Romana, with a handful of his forces, was at Villa Franca. Cuesta having been joined by a small corps under the Duke of Albuquerque, had halted, in his retreat before the French, in Vera Cruz. General Reding, who had been several times defeated near Terragona, and who had been foiled in an attempt to surprize Barcelona, had been reinforced by some troops from General Blake, and both were employed in harassing the progress of the French in Catalonia. Marshal Soult (the Duke of Dalmatia) was at Oporto; the Duke of Elchingen (General Ney) occupied the neighbourhood of Corunna and Ferrol; and the Duke of Belluno (Marshal Victor) was advancing towards Lisbon on the north of Badajos, whilst Cuesta and Albuquerque retreated before him. After the junction of these commanders, the former thought himself sufficiently strong to give battle to the French under the Duke of Belluno, who had advanced to Medellin with 20,000 foot and 5,000 cavalry. Cuesta suffered a severe defeat, and some of his regiments behaved with notorious cowardice; but other bodies of his troops were deemed to have displayed so much gallantry, and the conduct and spirit of the General appeared in such a light to his countrymen, that the Supreme Junta issued from Seville a decree appointing him captain-general of their forces, and honorary as well as pecuniary rewards to his soldiers.

The resolution of Britain still to make common cause with the Spaniards, was expressed early in the year by a solemn treaty between the two powers. Don Pedro Cevallos (the author of the Exposition of Bonaparte's Conduct towards Spain) came to London, as ambassador from the Junta, with full powers to ratify an alliance which had hitherto received no formal ratification. His Britannic Majesty bound himself, by the treaty, not to acknowledge any other king of Spain and the Indies, than Ferdinand the VII. or his lawful successors acknowledged by the Spanish nation.

The war between France and Austria had scarcely commenced, when the ministry, who had so loudly condemned their predecessors for having failed to co-operate in the last continental campaign, determined on sending to the Continent a very powerful expedition. The Earl of Chatham was appointed to command,—a choice which was exceedingly unpopular, and cast an "ominous conjecture on the whole success." The proverbial indolence of that nobleman's character was the first reproach of minister's respecting the expedition; and it was their last, though tacit, apology for its failure. But the real history of the commander's proceedings fully proved that the object of the expedition, not the hand to whom it was entrusted, was the blameable cause of disaster. The public learnt, when it was too late, that Mr. Pitt, to whom the same expedition had been suggested, had seriously sounded the difficulties of it, and, after consulting the ablest military and naval authorities, men who knew and had examined the enemy's

strength on the spot, had renounced it as utterly inadvisable.

Towards the end of July, this armament was assembled on the shores of England, the largest that had ever been prepared in this country. It consisted of a military force of 34,000 infantry, 2000 cavalry, and 16 companies of artillery; the whole was commanded by Lieutenant-General the Earl of Chatham; and of a naval force of 39 sail of the line, and 36 frigates, besides mortar-vessels and gun-bots, under the orders of Rear-Admiral Sir Richard Strachan. This conjoint expedition had for its object the capture or destruction of the enemy's ships either building at Antwerp or Flushing, or afloat on the Scheldt; the destruction of the arsenals and dock-yards at Antwerp, Terneuse, and Flushing; the reduction of the island of Walcheren; and the rendering (if possible) the Scheldt no longer navigable for ships of war. The arrangements with respect to the debarkation of the army, were, for the most part, entrusted to Sir Home Popham: indeed, by many, it was supposed that he was the original mover of the expedition, and that the general disposition of attack had been suggested by him. The plan of the expedition was thus traced in outline before it sailed. The occupation of Walcheren was confided to Lieutenant-General Sir Eyre Coote, and the left wing of the army, consisting of 13,000 men. The naval arrangements of this division were under the immediate direction of Rear-Admiral Otway. The point of debarkation depended upon the directions of the wind, and farther operations on the state of the defences of the island; for such was the information of those who planned the expedition, that it was doubtful whether Veere, Middleburgh, and Flushing, were not places of considerable strength, each requiring a separate attack. Lieutenant-General the Marquis of Huntly, with 5000 men, was to land upon the island of Cadsand, and to maintain himself in an entrenched position, with a view to cut off the communication between the town of Flushing and the Continent. Commodore Owen was to co-operate in this part of the service. A force of 5000 men, under Lieutenant-General Grosvenor, was destined to occupy the island of Schouwen; while Lieutenant-General Sir John Hope, with the reserve of 7500, was to land, and carry the island of South Beveland, and to act as a corps of observation during the attack of Walcheren. Sir Richard Keats had the naval charge of the reserve. The remainder of the army under Lieutenant-General the Earl of Roslyn, was to remain embarked until their services should be required for the ulterior object of the expedition. The commander-in-chief, with the divisions of Sir John Hope and the Marquis of Huntly, sailed from the Downs on the morning of the 28th of July, and anchored in the evening off Walcheren. Sir Eyre Coote's division sailed a day later, and joined the head-quarters on the morning of the 30th. General Grosvenor's division, sailing from Harwich, anchored in the channel called the Roonpot, (between North Beveland and Schouwen,) on the 1st of August. On the same day, Sir Eyre Coote's division, which had already landed on Walcheren, obliged the garrison of Veere (amounting to 519 officers and soldiers) to capitulate, and established its head-quarters at Middleburgh, which capitulated also. The commander, at the same time, detached a corps to reduce the fort of Rammikins. This place surrendered on the 3d of August, and a way was opened to our vessels into the West Scheldt. A British flotilla,

VOL. IV. PART II.

in the mean time, had advanced through the Sioe-passage; so that we now commanded the approach to Flushing by our troops on the north, and by our naval force on the east and west sides; but the investment to the southward was not yet effected. While Sir Eyre Coote's division was thus employed, the reserve took possession of the island of South Beveland; but this corps, from the 2d of August, remained merely as a corps of observation. In the mean time, the shores of the East Scheldt having been unexpectedly found defenceless, General Grosvenor's division, instead of disembarking on the island of Schouwen, landed on the coast of Walcheren, and proceeded to assist in the operations before Flushing. The original plan of attack was to reduce the place by means of bombardment; a mode of capturing places by no means so certain in its effects as a regular and scientific siege. It is also contrary to every principle of humanity, as well as policy, to aggravate the horrors of war, and excite the hatred of the people, which, after the conquest of the place, may be of the most serious disadvantage to ourselves. It was a part of the plan as we have seen, that the Marquis of Huntly should land upon the island of Cadsand, and cut off the communication between Flushing and the Continent. Unhappily this part of the plan was frustrated, by the force of the enemy being stronger than expectation. Before our smaller armed vessels could intercept the communication between this island and Flushing, the enemy had thrown from thence into the latter garrison about three thousand men.

The town being completely invested, some inconvenience was at first apprehended from the enemy cutting the Dyke: our trenches were, in many parts, made useless, and the platforms of some of the batteries were partly overflowed. The batteries, however, with the exception of one which was called the seamen's battery, was mounted with artillery on the 13th of August, and, at noon, a tremendous fire commenced on the devoted town. A flotilla of bomb vessels and gun boats were stationed on each side of the town, under the orders of Captains Cockburn and Owen, to assist in the bombardment. The artillery was pointed with the sole view of destroying the houses, magazines, and other buildings. The commanding general, (Sir Eyre Coote,) however, being doubtful of the success of the bombardment, and alarmed at the progress of the inundation, which now began seriously to impede our operations in the low ground, determined to carry forward the attack along the dykes on both flanks of the place. In the evening, therefore, a lodgement was made on the right of the line, on the sand hills, between the dyke of the Nolle, and the body of the place; and operations were also projected for a nearer approach on the left of our position. During the whole of the night, an uninterrupted fire was kept up from the batteries, and, on the morning of the 14th, the seamen's battery being added to the rest, and the line of battle ships being enabled to advance, the attack was carried on with still greater fury. At the same time, a breaching battery was marked out in such a position, that had it been completed, its fire, in the course of a few hours, would have laid the rampart open, and exposed the enemy to an immediate assault. At four in the afternoon of the 14th, the firing was suspended, and the Earl of Chatham directed the commanding general to make an offer of terms to the garrison; but as General Monnet refused to surrender, at nine o'clock in the evening the fire of the batteries

4 R

recommenced, and the bombardment was furiously renewed. At one o'clock in the morning of the 15th, the French made offers of a capitulation, which were immediately negotiated and signed; the garrison, in number 5803 men, laid down their arms, and were to be sent as prisoners to England. When our army entered Flushing, the dreadful effects of the bombardment were discovered; more than 247 private houses, and several public buildings, were in ruins, many hundreds of inoffensive citizens, and women and children had lost their lives, and a far greater number were wounded. The French garrison had suffered little. In the dock yard there were found a line of battle ship, a frigate, and a brig, in a forward state of construction.

Before the attack on Flushing had commenced, the divisions of the Earl of Roslyn and the Marquis of Huntly had landed, and occupied cantonments in South Beveland. From this time the Earl of Roslyn took the command of the island, and established his head-quarters at Ter Goes. On the 15th, a capitulation was entered into with the islands of Schouwen and Duiveland, by the Earl of Roslyn and Sir R. Keats, and a detachment was sent to occupy the capital of the former island. On the morning of the 16th, ten frigates which had forced the passage of the West Scheldt, anchored in front of Bathz, a fortified position at the south-east extremity of the isle of South Beveland, which was of the utmost importance to the ulterior object of the expedition.

But, however unprepared the enemy had been at our first arrival, their situation and defences were soon formidably improved. Large reinforcements of their troops had arrived. On both banks of the Scheldt batteries were erecting to prevent the farther advance of our ships, and a boom chain had been already fixed across the river, between Forts Lillo and Liofkenshoek. Measures had been taken to cut the dykes of Tholen, and thus overflow the country between that place and Bergen-op-Zoom. General Bernadotte had arrived at Antwerp, and as French and Dutch troops continued to pour into that town and Bergen-op-Zoom, it became doubtful whether (setting aside the question of a siege) we had a sufficient disposable force, after the fall of Flushing, to cope with the enemy in the field. While yet the extent of the difficulties must have been foreseen, the movements of our forces, for a time, strongly indicated a determined view upon Antwerp. Soon after the British troops had entered Flushing, a division of line of battle ships proceeded up the West Scheldt towards Bathz. Corps of troops were passed from Walcheren, and divisions were re-embarked on board transports, and ordered to rendezvous, with the rest of the army, at Bathz. Horse transports, store-ships, gun-boats, fire-ships, all were concentrated to this point. Eight days and a half after the surrender of Flushing, head-quarters were established at Bathz. On the 25th, the earl of Chatham held conferences with several of the general officers of the army. On the 26th and 27th, councils of war were held; and it was soon understood that the ships of war and transports would immediately retire, and that south Beveland would be evacuated without any farther attempt or demonstration. Sir John Hope was entrusted with the final evacuation of South Beveland. The islands of Schouwen and North Beveland were also evacuated; and, on the 4th of September, the rear guard of the reserve was embarked on board a squadron of frigates, under the command of Lord William Stuart, which sailed at once for the lower

part of the West Scheldt. The line of battle ships, and other armed vessels, with all the transports, had taken their departure, so that, after the 4th of September, Walcheren was the only island in the province of Zeeland which remained in our possession. It is much to be regretted, that the evacuation of South Beveland was not decided upon, as it might have been, immediately after the fall of Flushing. It was evident the enemy's fleet in the Scheldt could not then be attacked with any hope of success; and if that part of the army which was not necessary for the defence of Walcheren had been sent to England, we should not only have been spared the mortification of an inglorious retreat, but we should have saved the lives of a number of gallant soldiers.

About the middle of August, the disease incidental to the climate began to spread, and many of our men were sacrificed, in Beveland, to its effects. Not less dreadful were the ravages of the disease in Walcheren. In the course of two months we lost 1700 men; and towards the middle of September, the average number of deaths was from 200 to 300 men a week.

After the evacuation of South Beveland, no military event of importance occurred. On the 14th of September, the earl of Chatham embarked and set sail for England, leaving Sir Eyre Coote, with 15,000 men, for the defence of Walcheren. Lieutenant General Don was afterwards appointed to succeed Sir Eyre Coote, and he arrived at Walcheren on the 24th of October. During the whole of this time, it was uncertain whether our troops were to form a permanent establishment on the island or not. A month was wasted in hesitation and delay; and, extraordinary as it may appear, the greatest activity began to be displayed at the time when it became doubtful whether we intended to maintain or abandon our conquest.

About the middle of November arrived the order to evacuate the island, and demolish the works and naval basin of Flushing. On the 23d, the island of Walcheren was completely evacuated by the British army. The land fortifications of Flushing, the defences of Veere, and the fort of Rammikins, all of which had been improved at considerable expense, were left in a much better state than when they first came into our possession.

While the tremendous and concentrated power of France was overwhelming the centre of Europe, it may be questioned, if all the disposable force of Britain could have availed in co-operating against her, had it been even pointed to one quarter; but, if solid and undivided co-operation was insufficient, much more was a desultory system of diversion likely to be fruitless. Besides the expedition to Walcheren, an attempt was made, during the summer, to invade Naples. Sir John Stuart embarked from Messina in June, from the island of Sicily, with 15,000 British troops, and a small force of Sicilians. A brigade, which was detached to the Calabrian coast, took possession of a line of posts which the French had erected opposite to Messina. The island of Ischia was the first point of attack of the main army: its fortified and rugged shores were possessed by the gallantry of the troops; and, in a short time, two garrisons and a flotilla of gun boats surrendered, 1500 regular troops were made prisoners, and 100 pieces of ordnance were taken. So far our arms were successful; and it appears that the diversion occasioned the recal of some of the French troops who were to

have joined the army of Italy, as well as of a portion who were to have marched into the papal territories. But the attempt on the continent and city of Naples was abandoned; for, besides a regular force which king Joachim had assembled, a large body of national guards had been embodied. Of the natives, there was now sufficient time for many to be personally interested in the new dynasty, by sharing in the powers and rewards of office; and there was a still greater number paralysed by fear of the usurper, or neutralised by distrust of the real value of their ancient government. But, though disappointed in his views upon Naples, the British commander determined to occupy Ischia, and to take possession of Scilla Castle. While operations were rigorously proceeding against the latter place, the enemy suddenly appeared in superior force, and obliged the besiegers to sail for Messina. They disappeared in a short time, and the British renewed the attack; but the French again presented themselves as suddenly as before, and the British, after four days possession of the fortress, were forced to abandon it, with all their other conquests.

The failure of the expedition to Walcheren was followed by no scrutiny that could satisfy the public mind; but it brought to light a personal dispute in the cabinet. On the 22d of September, a duel took place between Lord Castlereagh, secretary for the colonial department, and Mr Canning, the secretary of state for foreign affairs. The grounds of Lord Castlereagh's challenge were, that Mr Canning having conceived his lordship inadequate to the duties of his high station, had clandestinely obtained a promise of his removal from the duke of Portland; and during six months that the plan of his dismissal was in agitation, had disingenuously concealed the circumstance from his lordship's knowledge. It appeared indeed undeniable, that Mr Canning, who had denounced the other to the premier as an incapable war minister, far from disclosing this opinion to Lord Castlereagh himself, had treated his lordship as if he still possessed his confidence, and had allowed him to plan and to carry into execution the most expensive and formidable armament that ever sailed from the British shores. The affairs of Spain called for a vigorous minister to be sent from this country: Lord Wellesley was accordingly gazetted to that appointment; but he delayed from May till August, till the Walcheren expedition should sail; while the interests of Spain were neglected, that he might succeed Lord Castlereagh as war secretary. Even Lord Castlereagh's removal was not to take place, unless it could be reconciled to his lordship's feelings. It appeared, that such had been the clashing of personal interests, such the indecision of our councils, that four different arrangements, respecting the business of the war department, had been resolved upon in the space of as many weeks; while Bonaparte was subverting the last independent empire in Europe.

In the mean time, the ministry was completely broken up. The duke of Portland, who had exerted his matured and experienced talents in the cabinet, but which had been rendered too inefficient to his country by the bodily agonies which he endured under the disease of the stone, resigned, on the verge of death. Lord Castlereagh and Mr Canning resigned formally after their duel. By the demise of the duke of Portland, the superintendence of his majesty's councils devolved on Mr Perceval. He wrote to Earl Grey and Lord

Grenville, inviting them to assist in forming an extended and combined administration. The offer, however, was not such as to warrant the acceptance of those noblemen. Application was made more successfully to the Marquis Wellesley, who succeeded Mr Canning as secretary in the foreign department; Lord Liverpool was transferred from the home to the war department; and Mr Ryder was placed in the room of Lord Liverpool. Lord Palmerston was appointed secretary at war, in the room of Sir James Pulteney.

The hopes of effectually assisting the peninsula had no sooner been animated by the rising of the Spaniards in Galicia, and the approach of an Austrian campaign, than Sir Arthur Wellesley was detached with an army, small but well appointed, with immediate orders to act in Portugal, but with discretionary powers of extending his co-operation to the Spaniards. He landed at Lisbon on the 22d of April. General Soult, who had penetrated through Galicia, and left that country behind him, without dreading the insurrection which shortly after broke out, had possessed himself of Oporto, and intended, undoubtedly, to have marched to the south of Portugal, where he expected to effect a junction with Victor; but, learning that a formidable British force had landed, he attempted to force a retreat into Spain by the route of Zamora: For this purpose it was necessary to possess himself of the pass of Amarante; but the Portuguese general Silveira so obstinately defended this approach, that he was obliged to retreat back to Oporto. Marshal Victor was at this period at Merida, while Cuesta held a position at Monasterio. Conceiving that Victor's force was sufficiently watched by the latter commander, Sir Arthur Wellesley determined to advance against Soult, and to drive him from Oporto. But Soult, sensible of his inequality to meet the combat, and wishing, at the same time, to give Marshal Victor an opportunity of pushing into the south of Portugal, withdrew the main body of his army, and left his rear guard at once to entice his pursuer, and to protect his own retreat. An action took place between the advanced guard of the British and the rear guard of Soult at Vendas Novas, in which the former, being gallantly supported by a Portuguese regiment, drove the enemy from a strong position on the heights above Grijon. The enemy then retreated across the Douro, and opposed the passage of our troops: the river was crossed, however, with the characteristic valour of British soldiers, and Oporto was recovered. Sir Arthur Wellesley even hoped to cut off the retreat of Soult. The Portuguese general Silveira was posted upon the Tamaga. If he had been able to have held this position, no retreat could have been open to the enemy, except across the Minho; but the loss of the Bridge of Amarante, which the Portuguese were unable to defend, afforded the French a passage into the north of Spain. Sir Arthur Wellesley left the pursuit of Soult to protect Lisbon and the south of Portugal from Victor.

In the mean time, the affairs of the patriots in Spain were checked with alternate success and disaster. On the Minho they repulsed Marshal Ney (Duke of Elchingen) and General Loison at the head of 8000 men. Forcing Ney to retreat, they bravely recovered Corunna and Ferrol. They got possession of St Andero; but this last place was the scene of a tragical reverse,—it was recaptured by the French general Bonnet, and 5000 patriots were put to the sword. In the north east

of Spain, General Blake threw succours into Gerona, which nearly rivalled Saragossa in the bravery of its defence. He endeavoured also to relieve Saragossa; but exposed himself, in a rash encounter with General Suchet, to a total and disgraceful defeat. His troops, struck by a sudden panic, abandoned their baggage, their artillery, and their arms. Blake was thus obliged to abandon Arragon, and endeavoured, at a distance from the enemy, to restore discipline to his army.

Still, however, the French thought it imprudent, while their reinforcements were abridged by the war in another extremity of Europe, to advance to the south of Spain. Before they could reach Seville, it was necessary to possess the passes of the Sierra Morena; and, in the strong-holds of these passes, the enemy dreaded to attack the Spaniards under Venegas. Leaving that quarter unassailed, King Joseph sent reinforcements from Sebastiani's army to General Victor; whose army, thus strengthened to the number of 35,000, took its station along the Alberche, and in the neighbourhood of Talavera. His design was to oppose the march of the united Spanish and British armies against Madrid; for Sir Arthur Wellesley, after returning from the pursuit of Soult, judged it expedient to direct his force against Victor, and for this purpose determined to co-operate with Cuesta.

On the 20th of July, a complete junction of the allies had taken place; and relying on the auxiliary movements of Sir Robert Wilson, (who, with a well-disciplined Portuguese corps, was ordered to Escalona,) and the division of Venegas, which advanced to Argonda, the grand army proceeded to Talavera, where the right of the enemy's outposts was driven in. On the 24th, the corps of Victor fell back from the Alberche, and formed a junction with the army of Sebastiani. The French having at last combined all their forces, including the garrison of Madrid, the guards of King Joseph, and the corps of Sebastiani, Victor, and Jourdan, first repulsed Cuesta, who had attempted to pursue them.

The Spanish general fell back, after his repulse, upon the British army; and the allies, determining to await the attack of the enemy, stood in a strong position at Talavera. Their united numbers amounted to 64,000 men, of which 26,000 were British. On the 27th of July, the French, 45,000 strong, advanced to a general action, in which they attempted every quarter of the allied army without success. Being completely repulsed, they retreated across the Alberche, with the loss of 20 pieces of cannon, and, according to our calculation, of 10,000 men. The loss of the British, on whom the stress of the action fell, was not less than 6000. The Spaniards, who fought bravely, though they were less engaged, had about 1000 killed and wounded. Abundant triumph has been made over this victory. We confess it appears to us a less remarkable achievement than the other victories of Lord Wellington, that 64,000 men should, upon a strong position, repulse 45,000. It has been said that the Spanish troops were undisciplined, and contributed little to the victory. This fact we deny; for the army of Cuesta was the best disciplined of the Spanish troops. The Spaniards covered the right wing; and it was by their aid that general Campbell's brigade, which occupied a commanding position in the centre of the armies, was enabled to hold its position, and to capture the enemy's artillery. That the Spaniards were less engaged than the British is certain; but their usefulness in the engagement certainly brought

the force of our army to a fair equality with the enemy, if not to such a superiority on our side as might be reasonably expected to produce a victory.

But the allies had scarcely time to congratulate themselves on the victory, when it was found that the situation was dangerous and untenable. Soult, Ney, and Mortier, having formed a junction, had advanced through Estremadura, and got over in the rear of the British; while Victor, though defeated, had still 30,000 men. Leaving Cuesta to defend Talavera, and to take care of the British wounded, Sir Arthur Wellesley marched, on the 3d of August, to Oropesa, in the direction in which Soult was advancing. On the evening of the same day, however, he was informed that Cuesta meant to leave Talavera immediately, dreading that the British would be unable to oppose the united numbers of Soult, Ney, and Mortier. The hospital of the British wounded, which the English general had entrusted to him, Cuesta was obliged to abandon to the French.

From this perilous situation, Sir Arthur Wellesley retreated as fast as possible by Deleytosa to Jaraicejo, where he remained for some time, with his advanced posts on the Tagus, unmolested. But his distress for want of provisions, and the means of transport, which he had incessantly and in vain represented to the Spanish government, still continuing to increase, he found it necessary to retreat to Badajos, on the frontiers of Portugal. Here, during the remainder of the year, his army remained, not only inactive, but exposed, from the unhealthiness of the situation, to the ravages of a very fatal disorder.

Gerona, the key of Catalonia, had maintained, as we have already mentioned, a noble and protracted resistance. Almost the only strong part of it was the castle of Montjoi, but even after this had been reduced to a heap of ruins, the city still stood. By a dexterous and bold manœuvre of general Blake's, a relief of provisions and ammunition was thrown into the place, and its garrison raised to the effective strength of 3000 men. The French generals, St Cyr and Verdier, after having made four ineffectual assaults, were recalled by Bonaparte from their command, and the siege was entrusted to Augerau, whose unwearied activity and superior numbers, at last succeeded in driving off the covering army of Blake, and taking Gerona by storm, after its walls were beaten down, and the strength, though not the spirit of its inhabitants, had been reduced by famine. Besides the fugitive army of Blake, the Spaniards still maintained, in the beginning of November, a central army under Cuesta and the Duke D'Albuquerque, and an army on the left under the Duke del Parque. The latter commander being posted at Zamanes, about six leagues to the south of Salamanca, obtained a brilliant victory over a considerable French army, lately commanded by Ney, but now under general Marchand. But advancing to Salamanca, he was defeated at Alba del Tormes, with immense loss. A similar fate befell the army of La Mancha under general Areisaja, which, attempting to penetrate to Madrid, was attacked at Ocana, and routed with the loss of 40,000 muskets and all its artillery. Thus, at the close of 1809, (a year never more perhaps to be paralleled in Europe for an opportunity of union against its common enemy), Spain witnessed the successive dispersion and defeat of her principal armies. Her supreme Junta still edited addresses full of pompous language, and confident expectations; while their measures were for every practical purpose, either torpid

or mischievous. Two circumstances indeed took place, from which a change in the character of their measures was expected,—the admission of the Marquis Romana into that body, and the arrival of the Marquis Wellesley as ambassador from Great Britain. But neither of these characters were able to instil into the Junta any portion of their own energy. The Marquis Wellesley only gained their tardy and reluctant consent to one important point, viz. the meeting of the Cortes. The 1st of January 1810 was fixed for their convocation.

The session of parliament was opened on the 23d of January, 1810. In his majesty's speech, although it was acknowledged that the principal ends of the expedition to the Scheldt had not been attained, it was confidently hoped, that advantages materially affecting the security of the kingdom would be found to result from the demolition of the docks and arsenals at Flushing. The expulsion of the French from Portugal by his majesty's forces under the conduct of general Wellesley, now created Lord Viscount Wellington; the late victory of Talavera; the spirit of unanimity displayed by the Portuguese; and the confidence reposed by their regent and their local government in our alliance;—these, as well as the assembling of the Cortes in Spain, were subjects of congratulation in the royal speech. The intercourse between his majesty's ministers and the American government, was stated to have been suddenly and unexpectedly interrupted; but the hope and desire of renewing friendly relations with that country, were strongly expressed. In the course of the debate upon the address in the lower house, the chancellor of the exchequer boasted, with considerable triumph, over those who had prognosticated the ruin of our trade from the effects of the orders in council; that the exports of the last year had not only exceeded those of the preceding, but of any former year in the most favourable period of peace. The exports of the year ending in October 1809 were greater, by seven millions, than during the most abundant years of trade and peace, and by ten millions than any preceding year of war. On the 27th of the same month, the commons resolved to institute an inquiry into the policy and conduct of the expedition to the Scheldt. The inquiry continued till the end of March. As the apology for the expedition, offered in the royal speech at the opening of the session, viz. that advantages affecting the security of the kingdom had resulted from demolishing the docks and arsenals at Flushing, was little calculated to satisfy the public mind, ministers were not only foiled in their attempt to preclude enquiry, but obliged to make a long and laborious defence of the measure. Lord Porchester, in moving a resolution of censure upon ministers, expressed his full conviction that no blame was imputable to either the military or naval commanders. The resolution, he contended, was preposterous in its objects, undertaken, not merely without regard to the insurmountable difficulties that lay in the way of those objects,* but against the predictions of the best naval and military authorities which had been consulted. Nothing but defeat could have been augured. The disappointments had been regularly traced, and distinctly foretold. Adverting to the evidence which had come before the house, he stated, first, that of Sir D. Dundas, who, early in the summer, had been questioned as to the chance of success in an attack upon Walcheren. Sir D. Dundas,

though unwilling to give an opinion, where sufficient information was not afforded, had spoken of Antwerp as a strong town, capable of standing a regular siege, at least till the whole force of France and Flanders could be poured upon the British; and urged Lord Castlereagh to consider the delay and disparity of force, which might make the expedition ruinous and disgraceful. The next evidence was that of General Calvert, who had warned the war minister, that the movements of our army must be subject to many impediments, and that the sieges of the towns must at all events occupy a period sufficient to allow the collecting of the whole Dutch and Flemish garrisons to overwhelm our few troops, through that most difficult country. Colonel Gordon, when consulted on the business, had concluded by declaring, in the most impressive and decided terms, that the enterprize was one of the most desperate nature. General Broderick's evidence established the conclusion which had been derived from the former authorities. General Hope, upon maturely weighing the whole matter, decided upon it, that the attempt would be full of hazard, likely to do much mischief if it failed, and little good if it succeeded; and leaving us this consolation in not making the attempt, that nothing of serious advantage was lost by our leaving it untried. Of five military authorities that were consulted, four were directly adverse, and one unfriendly to the plan. Lord Castlereagh, (said the noble mover of the censure,) appeared as if he had asked for advice only for the purpose of acting against it. Ministers had formed a plan for attacking Antwerp, and for the capture and destruction of the French ships, arsenals, and depots; yet it was not until after orders were given to prepare the troops for this service, that they had begun to arrange a plan of operations for making good their entrance into the Scheldt. The passage to Cadsand was indeed forced; but how was it forced? The gallant Captain Hanchett of the *Raven* had declared, that the shells of Flushing came aboard of his ship, while the round shot of Cadsand went through her; and Sir Richard Strachan had told them farther, that the ship was crippled and stranded. Against Antwerp, disposed as our forces were, we could have brought only 17,000 men. Was the French empire so low in respect to military resources in this quarter, a quarter where the channels of communication are so numerous, as not to muster an army from Flanders, from Holland, Westphalia, from the vicinity of Paris itself, sufficient to overwhelm so small an army? Only 17,000 men, of all our force, could have ever been brought to attack Antwerp, (setting aside all consideration of Fort Lillo, and of every obstacle to their advance upon Antwerp,) and yet it had been declared that 40,000 men were requisite to besiege Antwerp. Antwerp, according to the plan of Lord Castlereagh, was to have been taken by a *coup de main*; but in the event of an assault proving unsuccessful, the object was to be attained by bombardment. With regard to the *coup de main*, Lord Chatham had urged, in his own vindication, that to carry the place by a *coup de main*, was impracticable. The same was the opinion of General Sir W. Erskine, whose professional knowledge, displayed in his examination at the bar, had excited the admiration of the house, had stated, that having been at Antwerp in 1794, he knew it to be secure against a *coup de main*, and that in one week it might be put in a situation to stand a siege. Sir W. Erskine, too,

* Lord Porchester's speech on the Walcheren expedition, March 26th, 1810.

had mentioned his doubts respecting the expedition to Sir Richard Strachan, and by him they had been reported to Lord Castlereagh before the expedition sailed. It appeared that all the predictions of the former officer had been verified. Sir Eyre Coote, the Marquis of Huntly, General Calvert, had all agreed that the assault of Antwerp was either hazardous or impracticable.

From these facts, supported by evidence before the house, and from a minute survey of the diffuse and divided plan of operations given in the separate instructions of the commanders, Lord Porchester affirmed, that the enterprize, if not impracticable in itself, was at least rendered so by the bad arrangements of its contrivers. The pestilence, which had so frightfully destroyed our army, he said, was known to professional men, and must have been known to ministers. Was it forgotten what our troops had experienced from the climate of Walcheren in 1794? and yet the season was chosen for operation when that pestilence was known to be most fatal. After it was known in September, that there were 8000 sick in Walcheren, lying without medicines, without blankets, and without shelter, the most fatal delays had occurred in relieving the misery of our army. He was not disposed to lay all the blame of that delay on government; but when Lord Chatham relinquished the ulterior objects of the expedition, why had not the army been recalled from that scene of death and contagion, whilst it could be called an army? We were not to be told that Walcheren was to be kept as a military position, because it would cost more to retain it than it was worth, because our frigates could not remain at any time in the Veergat, Ter Teer being within the range of the enemy's shot and shells. The population of Britain could not supply the waste of such a position. Why had ministers been so callous to the sufferings of our brave men, while the country so deeply sympathised with them? Intelligence of the calamitous state of the troops was received on the 2d of September. On the 8th Lord Castlereagh resigned; and on the 17th Lord Liverpool's letter for the recal of the army was dated; but the whole of that period which should have been employed in arrangements for saving the lives of our soldiers, was consumed by ministers in their disgraceful squabbles for office. The last defence of the expedition to which his lordship alluded, was its acting as a supposed diversion in favour of Austria. All the evidence in behalf of ministers to this effect, was the opinion of Colonel Mosheim; who could state no other effect which it produced, than the return of two or three battallions from Louvain. It was known before the expedition sailed, that the defeat of the Austrians had decided the fate of the campaign, and the fate of the Austrian war. And this was the moment chosen to speculate in diversions, when France had every where a force completely adequate to the defence of every part of her empire.

Lord Castlereagh, in reply, acknowledged, that he could produce no formal opinions directly in favour of the expedition; but he had had a variety of conversations with military judges on the subject, which were so satisfactory, that he took the king's pleasure on the subject on the 14th of June, though the measure was not finally decided on till the 21st. He contended, however, that it was not necessary for government to protect itself, as to the policy of an expedition, by the previous sanction of military authority. He appealed, if the expedition to Buenos Ayres was adopted on previous mi-

litary information. The expedition, planned by the great Lord Chatham, against Rochefort completely failed: The officer to whom it was entrusted had an impression that it would not succeed, and applied for a specific plan of operations. Lord Chatham replied, that it was for government to judge of the policy of the plan: it was for him to look to its execution, and to judge of his measures from contingencies that might arise.

In answer to all the objections that had been urged against the expedition on the score of policy and delay, he would maintain, in the first place, that it could not have been sent out sooner, and that no where could it have been employed so advantageously. Some thought it would have been employed more advantageously in the peninsula, others in the north of Germany. Both parties reprobated its being employed in what they called a selfish object. It was our duty to send an army to the opposite coast, even though it should not be able to make a considerable advance from it. Four days before the expedition was determined on, government received news of the battle of Aspern;—were they not justified in sending an army to the continent, when the fate of the world depended on what was passing on the Danube? The battle of Wagram which followed, adverse as the result of it was, shewed *the person at the head of affairs in France* the danger of committing his crown to a second struggle. The issue of the combat was known to his majesty's ministers only the day before the expedition sailed. To prove that the expedition operated a diversion in favour of Austria, it was not necessary to show that troops were sent from the Danube to oppose it, it was sufficient if he could shew that troops were prevented from joining the army in Moravia; but it was a fact, that though no troops were sent from the Danube, the garrisons of Custrin, Glogau, and the other fortresses in Silesia, were concentrated, and sent into the north of Germany to oppose it. As to sending the expedition to that quarter, in the first instance, nothing could have been more unjustifiable. In the first place, it would have been necessary for them to create an army in the north of Germany; and were they afterwards to disgrace themselves by abandoning our supporters in that quarter? But although the object of the expedition was not selfish, he was content to defend the single object of obtaining Walcheren. The value of the place, in the opinion of our ancestors, had been proved in many cases. In the time of Queen Elizabeth it was retained. In 1747 it was also kept possession of. It had, indeed, been retained by many different administrations, and relinquished rather on grounds of military interest than medical inexpediency. The unwholesomeness of the climate of Walcheren, was not, however, to be imputed to him, as involving the fate of the whole army; it could, at most, only concern that part of it which was destined to the island itself, and did not involve that part which was destined to Antwerp, a place comparatively healthy. A hope had indeed been entertained, that the ultimate object of the expedition, the seizure or destruction of the ships at Antwerp, might have been effected before they got above that city, or even under the protection of Lillo. This hope was frustrated by one of those chances of war, which it was impossible to foresee, and for guarding against which no ministry could be responsible. The question then was, whether the advantages naturally to be expected from the expedition, were to be put in competition with the

risk? The effects of disease had proved greater than even medical men expected. Government had acted on the best possible information. The enemy had, at the latest, a force of only 30,000 men in that quarter. We had, including seamen, 43,000 men to act against Antwerp. It was confidently expected, that the navy would be able to co-operate against the place. General Sir W. Erskine had thought, that it could not be taken by a *coup de main*; but, with deference to that officer's opinion, he conceived it to be outweighed by what he conceived to be better authority. The fortifications of Antwerp had not been repaired since the days of the Duke of Parma. It was the opinion of Sir D. Dundas, that Antwerp might be reduced by bombardment like Copenhagen,—the latter city had out-works, Antwerp had none. The time spent before Copenhagen was ten days; Antwerp should have been reduced in half that time. In June, it is true, the enemy were said to have 20,000 men in that quarter; but the insurrection in the north of Germany, the ferment in Holland, the general spirit which arose in Europe from the news of the battle of Aspern, immediately after obliged the French to reduce that force to 11,000.* No effort appeared to be made for the defence of Antwerp, till the arrival of the British armament. We came upon them by surprise. If evidence, amounting to mathematical demonstration, were always to be required to justify military enterprises, what bold or great designs would be undertaken? there would be an end to enterprise, to the brilliant achievements which had raised the fabric of British glory. It was not on this cold principle, that Nelson ventured to attack the Danes at Copenhagen, or that Wolfe ascended the heights of Abraham. If such enterprises were to be sanctioned by official calculations, he would say, that the glory of the British empire was at an end.

Mr Grattan, in a subsequent debate, severely reprehended the ex-minister, for presuming to shelter himself behind the authority of Lord Chatham, whose wisdom and vigour formed so striking a contrast to the folly and weakness of his own administration. It had been avowed, that the armament was resolved upon, and prepared before ministers received intelligence of the fatal battle of Wagram, and the signing of the armistice; and that even after that intelligence, it was thought right not to stop it, but to send out the expedition; that was to say, that it being proper to send an army to create a diversion in favour of Austria while at war with France, it was also proper to send it after Austria had been compelled to make her peace. The arguments on the other side amounted pretty much to this, that having a disposeable army, it was absolutely necessary to make use of it; that was, to get rid of it. Ministers had

said, that they were not bound to abide by military opinions; and yet in effect they had relinquished that assertion, by contending that the opinions of military men were divided. He would contend, that the opinions of the best authorities were neither dubious nor equivocal. Sir D. Dundas had stated great risk. Sir John Hope had declared that, as soon as he saw the state of things, he was persuaded that the attempt was impracticable. Lord Roslyn was of opinion, that the expedition could not at any time have succeeded. Lord Chatham entertained doubts on the subject, but those doubts were borne down by orders from the admiralty. Sir Richard Strachan had expressed his conviction to Lord Mulgrave, that the expedition would fail. But ministers pretended that they had secret information, which fortified them against the fears and doubts of professional men. Take an example of this secret information, as delivered in the report of the secret committee. They had been secretly informed that Cadzand was without troops. On his arrival at Cadzand, the Marquis of Huntly found a landing impracticable, from the superior force of the enemy. Such was their secret information. The same credit was due to the representations of the dilapidated state of Antwerp, on which they founded the ulterior object of this ruinous enterprise. Ministers had sent out an expedition of one hundred thousand men, of the result of which the general had great doubts, of which the admiral had no hopes, without a plan of Antwerp or of Lillo, and without a plan of co-operation. It was in vain for them to say, that they hoped for every thing from the spirit of British soldiers, for they sent them to encounter the plague, over which no spirit could triumph. Long after a necessity for retaining Walcheren had ceased to exist, (if a necessity ever existed,) they had persisted in retaining it. In the whole transaction, said Mr Grattan, government could only be excused in their guilt by that parliament which would excuse them.

The result of these debates was a resolution of the house, (carried, however, by majorities smaller than usual,†) on the 30th of March, that, considering the value of the objects of the enterprise, the apparent probability of its success, his majesty's ministers were blameable neither for sending out the expedition, nor delaying to evacuate Walcheren. The army and navy were, by the same vote, absolved from censure; and the whole blame was laid on the state of the wind and weather, altogether unusual at the season of the year. In this opinion of the army and navy, it is probable that the nation fully coincided with its representatives; but it may well be doubted whether they were satisfied with the wind and weather being exclusively to blame, and, like

* This statement of Lord Castlereagh was contradicted by Mr Ponsonby within a short time of its being uttered. The number of the garrison of Antwerp, on the 26th of August, was 26,000 men.

† The debate closed on Friday, March 30th, when the house divided as follows:

For censuring the undertaking of the expedition,	227
Against such censure,	275
Majority,	48
For approving the undertaking of the expedition,	272
Against such approbation,	232
Majority,	40
For censuring the keeping our soldiers so long in Walcheren,	224
Against such censure,	275
Majority,	51
For approving of the keeping our soldiers so long in Walcheren,	253
Against such approbation,	232
Majority,	21

Lear, they might exclaim, in their mortification, "I tax not you, ye elements, with unkindness!"

The discussion of the Scheldt expedition was closely followed by another question, of which the issue, in the opinion of one part of the community, dangerously affected the liberty of the subject; but, in the opinion of others, was a necessary assertion of the constitutional privileges of parliament. On the 21st of February, Mr John Gale Jones had been committed to Newgate, by an order of the House of Commons, for a libellous hand-bill, containing general and individual reflections on the members of that house. The offender had not been three weeks in confinement, when Sir Francis Burdett moved the house for his liberation, not upon the principle that he had been sufficiently punished, but that the house had no right to assume such a power of punishment. The warrant of committal, Sir Francis said, was illegal in all its parts, but eminently so in its conclusion. A legal warrant must conclude with the words, "till the party be delivered by due course of law." This warrant ended with the words, "during the pleasure of the house." He valued the rights of the house; but from whatever part of the constitution an exertion of arbitrary power came, it was the high and solemn duty of every Englishman to oppose it. In such a matter there were two obvious questions of justice, "crime, or no crime?" The next question was committal. The house, he said, by such a proceeding, assumed at once a judicial, executive, and legislative power. This was in the very teeth of law. In the due administration of the law, it is provided that the same men shall not take two steps together. One set find the bill, another decide on the fact, another on the law; but that house, which administers no oath, which squares itself by no form, which makes no previous examination of the fact, jumps at once upon its dangerous and most alarming conclusion, and finds the accused guilty. Contending, therefore, that this committal was in principle an infringement on the royal authority, as well as on the right of the subject, and a violation of the law of the land, he moved, that "Gale Jones should be discharged." The attorney general, after shewing several cases which Sir Francis Burdett had quoted, of the power of the house being resisted by the judges, to be inapplicable to the present question, contended, that Jones might have appealed legally for redress, if he thought himself illegally committed. He might demand to be brought up to the King's Bench on a *habeas corpus*, and then the question would be set at rest. The court would then decide, not on the privileges of the house, whether the particular libel was a violation of them, but whether he had been committed according to the law of the land. The question, however, had been tried before in the Common Pleas, in the case of Mr Wilkes, where the then lord mayor was committed, for committing a servant of the house in contempt. It was then alledged, that the house had no right to commit for a contempt; but Chief Justice De Grey expressed, as his own and his brother judges' opinion, that the house *had* a right, by the law of the land, to commit for all contempts. Mr Sheridan, and some other members, moved an amendment, that Mr Jones should be released from Newgate, his punishment having already been sufficient; whilst they disclaimed the principle of Sir Francis, that the committal had been illegal. The original motion was however put, and rejected by a very large majority.

Several days after this debate, Sir Francis published

a letter in Cobbett's *Weekly Register*, addressed to the electors of Westminster, in which he declared, (among other irreverent expressions,) that the house, inflated with their high blown fanciful ideas of majesty, and tricked out in the trappings of royalty, thought privilege and protection beneath their dignity, assumed the sword of prerogative, and lorded it equally over the king and the people. This indignity, like the hand-bill of Gale Jones, the friends of privilege were determined should not pass with impunity. Mr Lethbridge moved two resolutions, that the letter in question was a libel on the house, and that Sir Francis Burdett had been guilty of a breach of privilege. They were both agreed to; after which it was moved, that Sir Francis should be committed to the Tower. The motion of committal was also carried. This was in the morning of Friday the 6th of April, and the speaker issued his warrant for the commitment of Sir Francis immediately. The serjeant at arms repaired with it to the baronet's house, but not finding him at home, returned between five and six in the morning, exhibited his warrant, and required obedience to it. The baronet replied, that the warrant was not one which he was bound to obey. The serjeant, unprepared with the necessary means of enforcing obedience, withdrew. On Saturday morning, the serjeant at arms, with his messengers, went again to the house of Sir Francis, and were again turned out. Soon after this, a troop of the life guards arrived in the street opposite to Sir Francis's house, and used means for dispersing the people, who continued to assemble in great numbers. Sir Francis, upon the appearance of the military, sent for the aid of the civil power, and the sheriffs and their constables came. Meanwhile the mob expressed their attachment to Sir Francis, and their indignation at the warrant, by breaking the windows of the houses of several unpopular characters, among which was Mr Lethbridge's, the mover of the business. Their tumultuary proceedings continued through Saturday night, and on Sunday an immense assemblage in Piccadilly pelted with mud every passenger who refused to pull off his hat in honour of Sir Francis. In the meantime, Sir Francis's declaration, that he would not submit unless to superior force, was thought sufficient cause for assembling the cabinet, and an order was transmitted from the war office to summon every regiment within three days march of the capital. A little before 11 o'clock on Monday morning, the serjeant at arms (accompanied by messengers, police officers, and a large military force,) broke by force into the baronet's house. He was sitting with his family, and on the appearance of the serjeant, asked by what authority he entered his dwelling. The serjeant produced the speaker's warrant, which the other persisted in refusing to obey. He commanded them to desist in the king's name, and called upon the sheriff for his aid. It was answered, that the sheriff was not there. Sir Francis then said, that they should not take him, but by force; he was accordingly taken with a shew of force to a glass coach which was in waiting for the purpose. He was conveyed to the Tower, guarded by an immense military force. The capture having been made at an earlier hour than the crowd had expected, he had passed from his house in Piccadilly up Albemarle street, before a cry was set up, "they have taken him, they have dragged him out of his house!" The cry soon spread far and wide; and before the carriage had reached the Tower, the mob had blocked up the Minories and all the streets in its

vicinity, so that it was necessary for cavalry to clear the way for his reception. This was effected with much tumult, but happily with no bloodshed. At the entrance to the Tower, some of the mob rushed within the paling, and even pelted the cavalry, who, in their turn, cut at them with their swords; but still without the loss of lives. On the return of the military, however, the insults of the mob provoked them to fire some shots, and several lives were lost among the populace. Some of the sufferers, as is usual in such cases, were not among the actual rioters, and the coroners, who made an inquest, returned a verdict of, wilful murder against a life-guardsmen unknown. Every part of the town was, on Monday night, paraded by troops, cannon were planted in several of the squares and streets, all the barracks and depots were filled with soldiers, and guards were mounted in private houses.

The important subject which now agitated the public mind, obviously contained two questions,—the particular right of the house over its own members, and their general right to commit a subject. But these questions had a connection which identified them in actual discussion; and as Sir Francis Burdett opposed the speaker's warrant on the broadest supposition of its illegality, his case needed no distinction from that of Gale Jones, except in the aggravation of his house having been entered by force.

While the extreme parties in politics recriminated on each other the blame of the bloodshed which it had occasioned, they respectively congratulated themselves on its issue. Ministers, that they had established the privilege; and the party of Burdett, that he had so boldly, however unsuccessfully, resisted an act which they deemed tyrannical.

But the extreme parties gained a temporary advantage by the dispute, which was of more importance to them than the settlement of a point in the constitution. The popularity of such a politician as Sir Francis Burdett, was not calculated to ride on calm water—it was kept alive by the passions of the multitude, which were now excited most tempestuously to his advantage. Ministers had also the double advantage of the public attention being recalled from the late Walcheren expedition, and of seeing the constitutional Whigs divided on this occasion. Many of their most respectable opponents, disgusted at the insults which were offered to the popular branch of the government, thought themselves called upon to support the dignity of parliament, and spoke of rallying round the constitution. Others entertaining different notions of the real rights of parliament, took the popular side; and, in point of legal authority, it appears that the Whigs, who opposed the unlimited committing privilege, were the highest. Respecting the commitment of Jones, Sir Samuel Romilly expressed the strongest doubts of the right of the house to interfere in such an instance.* “He doubted whether they had a right to commit for a breach of privilege in the case of a libel, on the conduct of one of their own members. He thought the house had a right to commit in a great many cases; such as where their proceedings were interrupted; where the people, by hissing or otherwise, insulted members coming to the house; where they threatened members, if they voted on a particular side; and in many cases of the like nature. But he made a distinction between libels publish-

ed on the past conduct of members, and proceedings still going on in the house. In the latter case, he had great doubts as to the right of committing; because the house acted as their own counsel, jury, and judge; because they were the accusers and the punishers. They began by reading the paper, and they concluded by ordering the party away without hearing him. Would any court of law act in that way? The house were the judges of the law and the fact, and the party was committed during their pleasure, without any appeal. But all this was only from necessity; and when the necessity ceased, the power also ceased with it. This was the doctrine held and started by Lord Chief Justice De Grey, in the case of Mr Crosby, who was committed, as a member of that house, for a breach of its privileges. The court of common pleas could not give any relief, because it did not know what were the privileges of the House of Commons. The chief justice said the commitment was lawful, because it was necessary; and that shewed, that if it had not been necessary, it would not have been legal. The house had been told of precedents and decisions of the courts of law. Of those which had been mentioned, the first was in the reign of the Tudors, and that was not a time (he thought) to which the house should refer in defence of its own privileges,—a time when the house were told, at the beginning of each session, that they were not to meddle with matters of state; and when Queen Elizabeth repeatedly told the house, that they were not to proceed any further in such and such cases. The case of Arthur Hall had been referred to in 1580; was it any thing like the commitment of the house? No; the sentence was to pay 500 merks, and to be imprisoned six months or longer, till he made a retraction. Was there any thing similar between the cases? Could the house now commit for an indefinite time, or for six months? Can it impose a fine, as was done in those days? He could himself cite many cases, in which the house had, in those times, made commitments of a most extraordinary nature, and sentenced men to as extraordinary punishments. There was one, of putting two men back to back upon a horse, and leading them through the streets, with a particular mark upon them. There was another, in which a new and extraordinary punishment had been invented by the house for the particular offence. But were cases like these to be cited as precedents on the present occasion? He was astonished to see it attempted. With respect to the case of Arthur Hall, Mr Hatsel takes notice of it in his book of Parliamentary Cases, and says, that it was afterwards declared to be derogatory to the dignity of the house. These were, in fact, not deserving the name of precedents; but were mere exercises of authority, for precedents are only the decisions of a legal judge. The house had also in later times carried their authority very high, in the resolutions which they from time to time passed. There was a resolution of the house, March 8th 1704, that no man who had been committed by the House of Commons, should dare to sue for a habeas Corpus; but the resolutions of the house were not the laws of the house.”

On the 7th of May, the speaker having informed the house, that he had received two papers and letters from Sir Francis Burdett, of an action which the baronet meant to institute against him in the Court of King's Bench the ensuing term; a select committee was ap-

* Sir Samuel Romilly's speech, 5th of April 1810.

pointed to inquire into the proceedings which had already past, and which ought to be adopted in future, respecting the letter and notice of Sir Francis. On the 11th the committee brought up their report, and, through their chairman, moved that the speaker and serjeant at arms should be permitted to appear in the Court of King's Bench, and plead to the said actions; and that the attorney-general should be instructed to defend the speaker and serjeant at arms.* In the debate which ensued on this report, while the high legal authority of Sir Samuel Romilly was opposed to ministers, Mr Ponsonby, who was regarded as the leader of the Whigs, spoke strenuously in favour of the right of parliamentary commitment, though he severely blamed the administration for bringing the house into its present difficulty, by having brought their real privileges to an unnecessary trial. Since the business, however, had proceeded so far, he thought the house could not retract from maintaining their rights. The two houses of parliament, he said, were the sole judges of their own privileges. No court in the country, however respectable the judges, could, or ought, to presume to meddle with the decisions of either house. That was the first principle which he should maintain. The next principle was, that whenever either house of parliament has declared its privileges, the courts of justice are bound to pay respect and obedience to them. He quoted Lord Hale, who asserts, that the law and constitution of parliament were founded on the law of the land, and must be taken as such; that parliament cannot be adjudged by any other court; and that the judges of the land had so confessed in many instances. This opinion Lord Hale took from Sir Edward Coke; and both agreed in distinctly stating, that the law of parliament was not merely so, but confessedly *lex terra*. Blackstone also had said, that the privileges of parliament were large and indefinite, and stated, that no court could interfere with the decisions of parliament. Sir Robert Atkins, one of the judges of the common pleas, says expressly, that the power of parliament consists of three heads: a legislative, a judicial, and a counselling power; and that they have the right of exercising the judicial power in defence of their own privileges. In a case of disputed privilege, it is true, Judge Holt had given as his opinion, that if the right of privilege in all questions was to be admitted, parliament would set no limits, and the people's liberties might be invaded. To that opinion the other eleven judges replied, that it was true: but still there was no limit to their authority; for the law of the land trusted that they would not misuse their privileges. According to the constitution of things, there never was a government in which some discretionary power was not invested. It must subsist somewhere. If the judges of the land were guilty of malversation in their judicial capacity, the house could punish them; but where was the higher authority than parliament? There was none. It might be said that parliament was responsible. So they were to the people. If the house acted wrong, the people had their redress by election; and, when the appeal was made, they might remedy the mischief which the former house had created, by electing other members in their room. The remedy was not to be found in an attempt to take away

their privileges. As to what had been said about *Magna Charta*, and that no man could legally be imprisoned by the law of the land, unless tried by his peers, it might as well be said, that many of the laws were contrary to *Magna Charta*; for instance, the canon and the ecclesiastical laws, which are not to be found in *Magna Charta*; but nevertheless they are the *lex terra*, and from immemorial usage, as much as if entered in *Magna Charta*. The privileges of parliament, acted upon from time immemorial, were as much the *lex terra* as any of the written laws; but then it had been said, that the house could not commit libellers to prison, because they would become judges, jurors, and executioners, in their own cause, and *Magna Charta* would not permit this. But did it ever occur to the modern writers, who threw out such an opinion, when they saw daily the judges of the land punish persons for contempt of court, by committing them to prison, that the judges were then judges, jurors, and executioners, in their own cause. The judges exercised that mixed right, and who could question it? Was it to be expected, that the judges would wait for a trial by jury before they could punish for a contempt of their authority? Were they to stand waiting at the door of a grand jury room, waiting for their finding a bill, subject all the time to the virulence of popular clamour, and without remedy perhaps, for six, twelve, or eighteen months, until relieved by the verdict of a jury? The privileges of parliament, he said, were not inroads on the liberty of the subject, but its safeguards. The commons, who represented the people, were their natural guardians, and their interests were identified. The people, he might be told, would not bear the exercise of those privileges; but our ancestors, certainly as high metttled, as watchful of liberty as the present generation, had borne them, when they declared, that one power and privilege vested in the commons defended the liberties of the people. It had been argued, that the crown would protect the people's rights. What! in a constitution framed like ours, was the crown to be the defender of the people's freedom? No; for (with personal reverence to the reigning monarch) the crown was disposed to be (though not essentially) the enemy of liberty. Why else were there checks put upon it, but that it was natural for man possessed of power to dislike controul? Had the history of England exhibited the crown as the defender of the people's rights? If at any time it should be found, that the house was too much an instrument in the hands of ministers, the remedy was easy, it was only to alter the constitution of it; but never let discretionary power be wrested from it. If the Court of King's Bench are to decide on this question of privilege, they might with equal propriety decide on all the privileges of the house, if called in question. If the serjeant at arms was intrusted to execute the orders of the house, and the person on whom they were to be executed chose to resist, and to beat the serjeant, or the messenger, and actions were to be entered against the party offending, the person might say, why, your officer behaved impertinently, and I beat him; and then the law courts must decide on this, and all the privileges. Was public opinion (he asked) to be the limiter of the judicature of the house?

* The effect of these motions was, that the speaker and serjeant should plead in bar to the said actions, *i. e.* that through the attorney-general they should go into court, and put in the plea, that the privileges of the House of Commons were concerned; that the house was sitting, and ordered certain acts to be done; that he, as speaker, had enforced those orders; that he did so by their authority; and that having done so by the order of the house, he pleaded in bar, and denied the authority of the court to interfere.

One politician would abridge them of one privilege, another of another, till, between factions bidding against each other at the auction of popularity, the house would have no privilege left."

The motion of the chairman of the committee, already mentioned, was then put and carried. It was next moved and carried, that the attorney-general be directed to defend the speaker and the serjeant at arms against this action. Mr Wynne rose to inquire, whether, in future, it was to be generally understood, that any body might bring actions of this sort against the house, without fear of its exercising the privilege of commitment. A recent case had been determined before the House of Lords, upon a question of privilege, which he therefore considered as analogous to the present. A Mr Hesse, a justice of peace, had acted under the immediate orders of that house, for the purpose of suppressing a riot. An action at law had been brought against him for his conduct; but the House of Lords committed both the principal and his agent, and would not consent to release them, until they gave Mr Hesse a discharge from his action. Was the house now to be understood as abandoning that course of proceeding? The chancellor of the exchequer said, that he was not then prepared to give an answer to the general question; but he would say, that, in every particular case, he thought the house was perfectly at liberty to exercise its own discretion; and, in the exercise of his best discretion and judgment, he did not think that it was necessary to commit the agent of Sir Francis Burdett.

On the 18th of May, Mr Grattan brought forward a new motion for the emancipation of the Irish Roman Catholics. We have noticed, in a former part of the history, how strong a prospect (a prospect coming near, if it did not amount to, an absolute pledge) of Catholic emancipation had been held out at the time of the union, to conciliate a larger portion of the Irish to that measure. Two years after the union, Mr Pitt, when leaving office, had declared his opinion, that an extension of the rights of Protestants to Catholics, was as innocent and safe after the union, as it had been dangerous before it.

Of the cause, it has been truly said, that there is not one name which has been loved in our own times, or will be revered hereafter, by any sect or school of

politicians, which is not ranked among its supporters. In times when Popery was still formidable, Locke and Judge Blackstone had anticipated the time and circumstances for enlarging the bounds of toleration, which time and circumstances were now arrived. In latter times, Adam Smith had pleaded in their favour; and Dr Johnson, thirty years ago, had pronounced, that those who would cry, No Popery, in these days, would have cried, Fire, in the time of the deluge. Pitt, Fox, Grenville, and Windham himself, men who differed in their views of all other reforms, coincided in this one. Within the pale of the English church, the cause of Catholic emancipation had been approved by no less authorities than a Watson, a Paley, and a Bathurst. It was not indeed easy to answer the arguments which abstract justice had to plead in favour of the Catholics; and arguments, too, which the dangers of the country, and considerations of policy, every day multiplied and confirmed. The exclusion of a fifth part of our whole population from the possibility of rising to high and important situations in the country, is an injury to the empire, which is thus deprived of the talents which might spring from such a mass of population. It is an insult to that excluded population, which extends still wider than the injury. It saps the foundation of their loyalty and patriotism, or, at least, gives us a weaker right to expect them. It turns the heart and the eye of the degraded Catholics towards that Catholic enemy of the country, who has an interest and pretext to offer his aid for obtaining to them all the rights which their own government denies. It deprives Protestantism itself of the surest triumph over Catholicism—of reformation. It keeps the Catholic more suspected, consequently more degraded, and consequently more bigotted and averse to the purer creed of Christianity.

The opponents of emancipation answer, that the Catholics have full toleration for their religion; they are not punished for going to mass, nor obstructed in the performance of it. To this, it is replied, that a penal law against Catholics, is still a penal law, whether it enjoins the punishment of death or of fine for their religion; and in what respects is the exclusion of the Catholics from the most honourable offices in the law, the army, the corporations, and the universities, different from a penalty? * The right of aspiring to such

* From the period of the Reformation to that of the Revolution of 1688, popery seems to have been considered rather as a crime, for which individuals convicted of any over-act were subjected to punishment, than as a system of faith, which the more powerful sect were solicitous to repress or extinguish by durable disqualifications. To celebrate mass, or to attend its celebration, were offences punishable by law; and every subject was liable to severe and unmitigable penalties, if he omitted to attend public worship, according to the forms of the established church, once at least on every Sunday. Catholics, however, notwithstanding the terrible religious rancour of those times, were neither excluded from the legislature, nor exposed to any hardships, respecting the enjoyment and transference of their possessions—or the economy and regulation of their families—or their personal rights and immunities. The truth is, that the early rigours exercised upon the Catholics, were rather meant as preventatives of heresy than as political distinctions. During the reign of Elizabeth, the laws against the Catholics were administered, upon the whole, with mildness and forbearance; in England and in Ireland they remained almost a dead letter. In the reign of James the II., however, when the Protestants obtained, for the first time, a decided majority in the parliament of Ireland, they were occasionally enforced with considerable rigour. Under Charles, the peculiar difficulties of his situation, and the authorised enormities of the English settlers, led to those scenes of more than savage devastation, which filled the rebellion of 1641. From that period, to the complete subjugation of the country by Cromwell, Ireland was a prey to the most frightful disorders, allayed occasionally by a military despotism nearly as terrible. The soldiery of Cromwell settled themselves in the lands of which they had dispossessed their opponents; and, at the Restoration, the act of settlement confirmed this desolating ejectment, by warranting the absolute transference of eight millions of acres from Irish Catholics to English Protestants.

Such was the state of servitude and penury to which the Catholics of Ireland were reduced on the accession of James II. It was natural to imagine, that, with the known dispositions of this prince in favour of Popery, he would endeavour, anxiously and effectually, to restore the political preponderance of this sect in Ireland. Tyrconnel, (as we have seen,) a blind and furious bigot, was selected as the instrument for obtaining the objects of the king. Except, however, the disarming of the Protestants, the dismissal of some officers, and the disbanding of four thousand soldiers of that persuasion, it does not appear that any very severe oppressions were exercised by the Catholics, to whom a concurrence of circumstances had now given the right of the strongest. Tyrconnel, indeed, had formed a scheme for calling a parliament, in order to reverse the act of settlement; but he was opposed so strenuously by the moderate Catholics in the king's council, that he was compelled to relinquish his project.

William III., called upon by the English people to rescue them from Popery and slavery, came over from a country partially peopled

offices is inherent in the free subject; it is not conferred by acts of parliament; but the statute which takes it away, is as essentially penal as if it deprived the subject of his personal liberty, or of any other right. The third objection to the measure is, that the Catholics would demand more than mere right, and would aim at religious supremacy in Ireland, if their present demands were granted. If it were even fair to deny what is due for fear of more being demanded, it could be easily proved, in answer to this objection, that the Catholics have not the power as legislators to sway the British parliament, and their attempting it by force, could only end in their defeat. But it is pretended, that the principles of the Catholics unfit them for trusts in society; they are bound to persecute; they are freed from the obligation of an oath, and can purchase absolution from all offences done or intended, from the lowest larceny up to regicide. This assertion is completely without foundation. At Mr Pitt's desire, in 1789 and 1790, the six Catholic universities of Europe were consulted upon the tenets of the Catholic Church, with respect to the faith that is to be kept with heretics, and allegiance to heretic sovereigns. The university of Douay, the Doctors of the Sorbonne, the university of Louvaine, those of Alcalá, Salamanca, and Valladolid, expressed their astonishment at the imputation of such principles, and the dispensing power of the Pope, gave exactly such answers as Protestant universities would have given, had they been consulted by Catholics on the Protestant opinions respecting murder, treason, and perjury.

The present coronation oath is another argument with the anti-catholics. But the coronation oath was framed when Catholics sat in both houses of parliament in Ireland, and were eligible to all offices, civil and military. The oath was framed in the first year of William and Mary, and Catholics were deprived of the rights which they are now reclaiming, by the 1st and 2d

of queen Anne. This is a fact, and it is a conclusive one, respecting the royal oath.

Unhappily, although the arguments for the cause were so strong, a shield of temporary evasion from them has been afforded to their enemies by the Catholics themselves. In a cause so good, it was indeed the misconduct of partizans, and not the arguments of opponents, that was most to be dreaded. The original managers of the Catholic cause were men of respectable rank, of moderate tempers, and of sound abilities. At their meeting in Dublin, in January 1799, (a time when the union was in contemplation, and when a state provision for the Catholic clergy was actually spoken of by the British government,) they agreed to the proposal of allowing the king (in the event of emancipation) a veto over the appointment of their bishops. In 1808, previous to the business being again brought forward in parliament, Dr Milner, the avowed agent of the Catholic prelates, renewed the concession on the part of the Catholic bishops, that, emancipation being granted, they would in future supply no vacancy without presenting the name of the proposed successor to government; and, in case of his being objected to, to present another and another name, till government should be satisfied with the loyalty of the nominee. This was announced in parliament, and immediately became the subject of discussion on the other side of the water. There is no reason to believe that the most respectable among the Catholics were at any time averse to conceding the veto; but there had risen in the popular meetings of this body, as there ever will rise in popular meetings, a set of rash, turbulent, and ambitious men, who envied the confidence and respect due to the superior leaders. These demagogues, attaching to their party all the bigotted and disaffected among their fellow-believers, raised a cry against the veto, which threatened a schism in the Catholic body,

with Catholics, and with an army chiefly composed of Catholics, to destroy the tyranny of a Popish prince in England. The means by which he effected the deliverance of the people whom he came to deliver indicate the beneficial consequences of a tolerating spirit. The liberties of a Protestant state were revived, affirmed, and augmented, by the leader of a Catholic army; and the principles of our constitution were framed under the auspices of an aid, which liberality had won over to the cause of freedom.

It was natural that, in this struggle, the Catholics should side with the monarch, in whom all their expectations were placed. They, accordingly, made every effort to sustain the fallen fortunes of James; and it was not until 1691 that the Protestant government obtained the full resumption and recognition of its ascendancy, by the treaty of Limerick. By the articles of that treaty, it was expressly stipulated, that "the Roman Catholics should enjoy such privileges in the exercise of their religion as are consistent with the laws of Ireland; or as they did enjoy in the reign of Charles II.; and their majesties, as soon as they can summon a parliament in this kingdom, will endeavour to procure the said Roman Catholics such farther security in that particular, as may preserve them from any disturbance on account of their religion."

In direct defiance of this solemn pledge, in peremptory violation of the sacred conditions, on the faith of which the instrument was ratified by the submission of the Irish people, three years had scarce elapsed, when the famous act for preventing the growth of popery was passed by the English parliament. The history of this act, though related by a crowd of respectable authorities, should nevertheless be perpetually repeated. When evils subsist for our shame, it is but fair that they should subsist for our instruction.

A party in England were in violent opposition to the government of William, whose principles, and, of course, those of his ministers, were known to be enlightened and tolerant. The opposition party resolved to make the king outrage his principles, or subject himself to the odium of protecting popery. In order to effect their object, they purposely brought in the bill alluded to, which they filled with a variety of absurd and wicked clauses, that the ministry might be compelled to risk its rejection. The court party seeing through this iniquitous scheme, determined to outwit their opponents, by sending back the bill loaded with additional absurdities, that its loss might be imputed to the original framers. They, finding their follies returned upon their hands, flung them back upon their adversaries. And thus this flagitious act, glutted with the rival resentments and united injustice of two parties, neither of which intended it to pass, was finally adopted by the legislature, contrary to the real wish of all branches of it, and of all the parties that composed it. In this manner were the liberties and fortunes of their fellow countrymen squandered away. This is, at least, the history of the English act, which was the avowed model of that which was afterwards passed in Ireland. By this abominable act, and the statutes which were subsequently framed, the Catholics were completely excluded from every constitutional advantage, reward, or immunity, excepting the elective franchise. Of this, too, they were deprived, in the reign of George I., by the action of a new policy on the part of England, the great object of which was to prevent the formation of an independent Irish interest.

From the accession of his present majesty, to the present time, our legislative annals can boast of a series of wise and liberal concessions to the Catholics; but they are still excluded by statute from all offices in the law, from all commands in the army, from all employments connected with the actual government and regulation of the state, from sitting in parliament, from holding corporate situations, &c. No Catholic can present to a living; though Dissenters and even Jews are entitled to this privilege. The qualification of a Catholic juror is made higher than that of Protestants, and no relaxation of the ancient code is allowed, except to those who shall conform to the oath and declaration prescribed by 13th and 14th George III. cap. 3.

and, by their noise and activity, succeeded in intimidating the prelates at the prospect of such a schism, to acquiesce in their absurd opposition.

The unreasonableness of the Catholics in refusing this concession, as a return for emancipation, has been acknowledged by their Protestant advocates; but Mr Grattan, in bringing forward his present motion, gave it as his opinion, that foreign influence, the object of such pretended dread, could be completely avoided, by another mode of security, viz. domestic nomination. Some of the Irish Catholics had, in fact, virtually agreed to the principle. It was not to be expected, however, that the Catholics were to come and make their offer to that house. Overcome them by justice (said Mr Grattan,) not by standing out upon terms: give them their just right in the first instance;—make it an article, if you choose, that they shall not elect foreign bishops;—but, at all events, act justly. But the Protestant friends of Catholic emancipation, while they saw with grief that the Catholics had furnished their opponents with a pretext for refusing the claims, did not consider the concessions of emancipation, even without a veto, to be half so dangerous as the present state of affairs. It must be noticed, that, at present, we do not possess the *veto*. What then is done by withholding the rights of that body, but continuing the danger of their disaffection, without gaining the veto? Emancipation, or no emancipation, the veto is not ours, until the Catholics choose to grant it. But the Catholics ought to grant it. True: but is it a matter of indifference that the Catholics should not be conciliated? If the House of Commons (said Mr Ponsonby, in supporting the motion) expected great concessions from the Catholics, they should at least begin by making small ones themselves. But it was evident, that veto or no veto, arrangement or no arrangement, the party in power were determined to concede nothing. To insinuate that concessions were refused, because no distinct offer had been made by the Catholics, was dissimulation and hypocrisy. Those who said so, had the words on their lips, but not the meaning in their hearts. All that was demanded was, to go into a committee on the subject. Would it be said, that the house ought never to go into the consideration of a petition like that of the Catholics, unless they were prepared to go the whole length of the claims of the petitioners? Let us contemplate the situation of Europe. The greatest warrior and politician, who had ever lived,—a man whose ambition is as gigantic as his views,—sways against us the subservient energies of a people, ambitious like himself, and whose ruling national passion is to put England down, that they may reign the masters of the world. With this power to contend with, would it not be sound discretion to look to our own resources? and when a committee is required to inquire into the grievances of so great a share of our population, is it the answer of statesmen, to say to those who plead for the petition, “you are not empowered to make certain arrangements, and we will therefore not inquire into the propriety of conceding

any thing?” Is it wise to tell the Catholics that they are to make all the advances, and then to sit silently and sullenly to receive them? The legislature ought to make the advances, for they possess the power of doing so; and, viewing the matter not as a theologian and a religionist, but as a statesman, it would be wise to do so. Force can never secure Ireland: It had been tried for centuries; and, at this very time, Great Britain is not more secure of Ireland than in the most troublesome times. To render her tranquil, her demands ought at least to be listened to.

Another parliamentary advocate for the Catholics, declared, in still stronger terms, his opinion, that the veto was not a necessary stipulation. This veto, said Mr C. Hutchinson, is a mere stalking horse,—the plea of desertion from the Catholic cause. On what ground was it required? Was the loyalty of the Catholic hierarchy impeached, or impeachable? He would challenge any man to produce a single instance of disaffection among the Catholic bishops;—an instance in which they had acted, or attempted to act, against the government. On the contrary, their fidelity to the state was so conspicuous,—their exertion in support of the government so signal, during the trying period of the insurrection, that they were denounced, among the leaders of the rebellion, as the Orange bishops—as strenuous advocates for the views of government. Why then demand any additional pledge of loyalty from such men? Mr. Grattan's motion was negatived by a majority of 213 against 109.

The friends of parliamentary reform were not discouraged by the defeat which Mr Curwen's bill had received in the preceding year. On the 21st of May, Mr Brand made a motion in the house for a committee to consider of measures proper to be adopted respecting a reform in the representation of the people. In a summary statement of his plan, he stated his objects to be, that parliament should exercise a right, which it certainly could constitutionally exercise, of disfranchising those boroughs in which the members were returned by the nomination of individuals, and, as the members of the house would be diminished in that proportion, to transfer the right of returning such members to populous towns. In counties, he would leave the elective franchise as it now stands, with the freeholders, merely adding the copyholders to the number of the electors. He proposed to assimilate the mode of voting in Scotland to that in England. As to the state of representation in Ireland, he was not disposed to propose any change. He should, however, bring that subject under the consideration of the committee, if his motion should be successful. He proposed triennial parliaments, and although the disfranchised boroughs had, in point of right, no claim to compensation, he should, however, vote for their receiving it. In changing the duration of parliament, he foresaw immense difficulties, unless a concurrent change were to be made in making the returns. He proposed, therefore, that the votes should be taken by districts,* instead of the returns being made by districts. There was one remaining point to which it was

* To exemplify this opinion, Mr Brand referred to the county which he represented (Hertfordshire.) If there were four members to be returned, and if they were to be returned by districts, that would throw the whole of the representation into the four principal towns of the county. The freeholders of the town would uniformly prevail over the freeholders of the county, because they would almost always outnumber them at an election. This would be to commute the county for the borough election. But if the votes were taken by districts, it would save much expense, and favour the pretensions of many, who at present are deterred, by a consideration of the expense, from offering themselves as candidates. Nothing need prevent the sheriffs from taking the votes throughout the different districts, without subjecting the candidate to the expense of bringing up the freeholders from the extremities of the county

necessary to call the attention of the house. The number of persons holding places and seats in that house, was an evil which required a remedy. He would not propose to exclude all persons who held offices, but all who held them without responsibility. The people, said Mr Brand, wish for a moderate reform; it is their right, and if it is refused, they will endeavour to assert it. There must be either a reform, or a military government.

The points and the facts so often asserted and denied, were largely discussed in this new trial of the question. The accustomed argument of the fate of France was not forgotten on this occasion, by the enemies of reform. In answer to this admonition, Mr Whitbread said, what has been the fate of other nations who neglected the means of national safety? Did Prussia reform? Did Austria redress the people's grievances? Why has Spain been the theatre of havoc and devastation? Were their miseries to be traced to the experiment of reform? Or rather, was it not the effect of the resistance with which their respective governments treated every proposition of redress and amelioration? Had Sicily reformed? and what, notwithstanding the liberal assistance of Great Britain, will be its fate, unless that government shall be wise enough to accede to the reasonable wishes of the people? Subjugated Europe had fallen, not because she made rash experiments on her systems of government, but by sanctifying every abuse, and pertinaciously refusing to accede to the just desires of the people. She destroyed the moral energies, and, though she placed arms in the hands of those who ought to be her defenders, there remained nothing of influence over their hearts, when brought in contest with the enemy. The motion was negatived by a majority of 234 to 115.

Among the prominent events of the session, it would be improper to omit mentioning the report of the bullion committee. The restriction of cash payments imposed upon the bank in 1797, have been noticed in the events of that year. Since that period, the paper money, not only of the bank of England, but of the country banks, had multiplied so rapidly; the value of that paper money had so much diminished in relation to the price of all articles of life; the market price of gold had risen so much above its mint-price, and coin and bullion had become so scarce, that these concurring appearances were naturally held in the general opinion, as cause and effect. It had been indeed predicted by many, that the dispensation from cash payments permitted to the bank, would produce the effect of depreciating paper by its abundance, and of raising the relative price of gold in proportion, by offering temptations to melt the coin, and to export both coin and bullion;—but these predictions were disregarded in 1797, by many who now thought more seriously on the subject,* or who did not imagine that the restriction act would be suffered to be so long in force. A committee during the last session, had been appointed to inquire into the high price of gold bullion, to take into consideration the state of the circulating medium, and to point out a remedy. The report of the bullion committee was given in on the 8th of June. They first inquire into the price of bullion, and find, that a

guinea is worth about 23 shillings of paper money; and this degree of depreciation of paper currency is confirmed by the rate of foreign exchanges, which are from 15 to 20 per cent. against England, though the real exchange would at present otherwise be in her favour. "It results from this unnatural state of things, that while a good guinea can only be current at 21 shillings, and that a guinea too light to pass in currency, gains value by its deficiency, and is actually worth 22 shillings. It is impossible, therefore, that any gold coin should remain in currency; and the result is, that the public lose about two shillings on a guinea on their income and expenditure.

The quantity of country bank notes is stated by the committee to be greatly dependent on the quantity of bank of England notes in which they are payable. One of the witnesses estimates these country notes at twenty millions; but they are probably worth more than thirty millions, as the gold coin in circulation used to be estimated at that sum when there were only ten millions of bank of England notes, making the then circulation forty millions, besides country notes, at that time perhaps five millions. Forty-five millions must have been augmented to fifty-four millions, to produce a depreciation of 20 per cent. as at present, whereby the country bank notes appear to amount to about thirty-four millions, the bank of England notes being twenty millions in circulation; herein supposing the augmented rapidity of pecuniary transactions to balance the greater quantity of them, and that the same amount of circulating medium is now as necessary as in 1797.

In the report of the committee it is stated, that the only true and effectual protection to the public against an excess of paper currency, is the obligation on the parties who issue it to pay it in specie at the will of the holder; that, since the year 1797, when that protection was taken away by the bank-restriction bill, the bank have extended the circulation of their notes from ten to twenty-one millions; that the country banks have also very considerably extended the circulation of their notes; that this increase of the circulating medium enhances the price of every commodity, raises the market price above the mint price of bullion, and occasions the present unfavourable state of the foreign exchanges.

While these views of the bullion committee were supported in numerous publications, and became an object of general interest, the directors of the bank, and the advocates for the new system, contended, in opposite pamphlets, that the increased quantity of the circulating medium is no proof of its excess; that the increase of the circulating medium is a stimulus to the whole commercial world, and extends our capital; that the amount of the circulating medium is not greater than the public necessities require; that the amount of bank notes issued cannot operate upon the price of bullion, or on the foreign exchanges; and therefore, that all the evils complained of must be traced to other causes.

That the value of money in these kingdoms has decreased, or, in other words, that the price of every article has increased to an unprecedented degree within these few years, is a fact of general notoriety; and cou-

to the place of election. The votes might also be collected throughout the different parishes in populous towns. Unless some such arrangements should be made, Mr Brand conceived that it would be impossible to establish triennial parliaments, without producing mischiefs of the most dangerous tendency.

* Mr. Huskisson, the great advocate for the resumption of cash payments, acknowledges that this was his own case.

pling this rapid change in the relative value of money and commodities, with the increased circulation of paper currency that has followed the bank-restriction bill, it will be difficult to consider them as having no bearing on each other. In the present state of things, the excess of bank notes cannot, as the governor of that incorporation asserted before the bullion committee, receive any check; for the directors will give the holder of a note nothing for it, except, indeed, a new note for an old one; and the demand for discounts furnishes them with the opportunity of replacing those that are paid in, by a constant succession of fresh ones. An excess of paper currency cannot be exported, and employed in foreign commerce like specie, and therefore it is necessarily employed in the purchase of commodities at home. The greater amount of notes there is in the market to purchase these commodities, the price of them will gradually rise till the increased value of the things to be purchased absorbs all the notes in circulation. Nor is this evil confined to articles of our own growth and manufacture, but extends to our foreign commerce, by its influence on the foreign exchanges; for, when the currency of a country is depreciated, it will no longer purchase the same amount of foreign money as before, to be invested in foreign commodities; but such an increased amount of the depreciated currency must be given as will counterbalance the extent of the depreciation. Or, to put the case in the opposite way,—if a merchant on the Continent is offered a bill of exchange upon London, for which he is to receive bank notes not convertible into specie, those notes can only be invested in commodities here at an advanced price, and therefore he will only take a bill of exchange at such a depreciated rate as indemnifies him for the advanced price of the commodities. Thus, in consequence of this over-issue of paper currency not convertible into specie, individuals pay a higher price for articles both foreign and domestic; a heavy loss is sustained by government in every purchase made for the public service, and in the expenditure of the army and navy on foreign stations, all of which must be made good by additional taxes imposed at home. Hence, too, arises the temptation to melt down and to export specie; for gold, while circulated here as current coin, passes only at the mint price of 3*l.* 17*s.* 10½*d.* per ounce, but, melted down into bullion, sells for 4*l.* 12*s.* per ounce. In proportion as the exchange falls, the value of bullion rises; for the greater the loss on making remittances of bills is, the higher price will the merchant give for bullion as a substitute for bills of exchange.

In support of the theory laid down in the report of the bullion committee, statements have been given of the amount of the bank notes in circulation, with the rates of exchange at corresponding periods. In January 1795, the amount of bank notes in circulation was nearly thirteen millions, and the exchange between Hamburgh and London was from three and a half to six per cent. against England. In February 1797, the amount of bank notes in circulation was only 8½ millions, and the exchange between Hamburgh and London was between 6 and 7 per cent. in favour of England. By the last returns laid before parliament, the bank notes in circulation were 21 millions; and the exchange between Hamburgh and London was 16*l.* 9*s.* per cent. against England. Statements have also been given, in order to shew that the quantity of bank notes in

circulation affects the market price of gold. In February 1797, it was 9*s.* 7½*d.* per ounce below the mint price: as the bank increased their issue of notes, it soon rose above the mint price, and now it exceeds it by 15 per cent. Counter statements have been produced by the bank directors, with the view of shewing that the increased issue of their notes has not been followed by a correspondent change in the rate of foreign exchanges, and the difference between the mint price and the market price of gold. It is obvious, that these effects of an increased paper circulation, may be retarded, or even counteracted, by other circumstances than our excess of paper; but the preceding facts and reasonings afford strong grounds for presuming that such effects will, in course of time, inevitably follow.

It is laid down in the report of the bullion committee, that while the paper currency of a country is convertible into specie, the greatest depreciation in the rate of foreign exchanges that can continue for any length of time, is the amount of the expense of conveying bullion from one country to another; and the average expense of transporting it between Great Britain and the continent of Europe, is stated, in the evidence before the bullion committee, to be 5 per cent. The actual depreciation is estimated, by Mr Huskisson, at 15 per cent.: if, then, the difference, or 10 per cent.: and a corresponding increase in the price of all commodities, be considered as the effect of the present over issue of paper, it will be found that the bank restriction bill costs the public as much as the property-tax, or 12 millions per annum; and that the continuance of this restriction, while it thus oppresses the individual, does no benefit to the state.

The advocates for the bank, without denying the general correctness of the theory advanced by the bullion committee, contend, that it is not applicable to the present case, and that the high price of bullion, together with the low rate of foreign exchanges, ought not to be attributed to the increased issue of paper currency, but to an unfavourable balance of trade and payments, occasioned by the great foreign expenditure of government, and the unprecedented restrictions imposed by the enemy on our commerce to the continent. Mr Hill, (in his Inquiry into the Causes of the present high price of Gold Bullion,) says, "I am decidedly of opinion, that since the year 1797, we have drained England by foreign expenditure, of a very considerable part of the specie and bullion, which at that time remained in it; that though the bank restriction bill, by reducing the domestic demand, prevented us from being sensible of the deficiency for some years afterwards, yet our stock is now reduced so low as to be inadequate to the limited demand which at present continues for it; and that this real scarcity of the precious metals in the country, is the genuine cause of the present high price of bullion." Mr Cock, treating of the same subject, observes, "As therefore we are not exporting gold from the cheap to the dear, but from the dear to the cheap country, all the usual observations about the expense of transmission, and the commonly adopted theories on the subject, are inapplicable to the case, which is evidently an unnatural one, occasioned by unnatural circumstances; and those arising, not out of the stoppage of payment in specie at the bank, but the stoppage of importation of British goods on the continent by Bonaparte." Mr Jasper Atkinson, in his pamphlet on the same subject, says,

"It is in evidence before the committee, that the unfavourable situation in which we stand, both in respect to our metallic currency and our foreign exchanges, arises out of the state of our payments abroad; and yet they make no mention of such a cause in their remedial recommendation." Some of the arguments of the advocates of the bank, prove too much. When those advocates assert, that the indefinite extension of paper circulation is a real blessing, they go to prove that you cannot give too much food to adventurous speculation; that you may with justice reduce to beggary every person of a fixed income in the kingdom. They would, in short, justify the assignats of France, or the swindling system once proposed by John Law. These assertions, which we have now quoted, are more respectable. They are, to a certain extent, true, but what is true in them proves too little. It may, and ought to be admitted, that an unfavourable balance of trade and payment, independently of paper issues, have contributed to aggravate the high price of bullion; but they do not prove, that the restriction of the bank payments has not also had its full share in the generation of the same evil, and has actually occasioned more than any other assignable cause, the unfavourable exchange with foreign countries. Their arguments do not invalidate the justice of the recommendation offered by the bullion committee, that the bank should resume their payments in cash. It appears also, from the report of the committee, that since the check on paper issues has been removed, the bank have not only doubled the number of their own notes, but have given rise to a country paper circulation, still more extensive. Before the restriction bill, the bank, we believe, never discounted bills to any banker; and while they adhered to this rule, no banker could trade upon artificial capital. Since the passing of the act, many of the London bankers have opened discount accounts with the Bank. This has contributed to increase the number of country banks. Since 1797, the number of country banks has increased from 230 to 721. The immense profits which the bank directors make by these discounts, prevents them from being scrupulous about the real solidity of the traders to whom they extend their discount. The public, in the mean time, is not more protected from the over-issue of those 721 country banks, than against the over-issues of the Bank itself. The Bank of England is the fountain head from which the country banks are supplied, and when the country banks are called upon to change their notes for cash, they give out Bank of England notes.

The cause of the depreciation of paper has been strenuously disputed. That its abundance causes great depreciation, and that such depreciation must increase with the increasing issues, until the bank shall pay in gold, has been distinctly proved. We do not deny that the state of our commerce may have contributed *also*, though in a lesser degree, to augment the scarcity of bullion. The existence of depreciation is not, however, disputable, whatever be the cause.

Mr Bosanquet himself has, in his second edition, given up completely the question of depreciation, in reference to our legal tender; and without any allusion to it as a temporary occurrence, he proposes an entirely new standard of value, from a comparison with which he infers that our currency is not depreciated. He proposes that the interest of $\text{£} 33 : 6 : 8$, in the three per cent. stocks, should be the standard measure of the value of

our currency. This is in effect saying, that a one pound note of the Bank of England is to be the standard by which we are to judge of the depreciation of that same one pound note. To this bold and alarming doctrine, it is to be trusted the public will never submit. If the bank directors, forsaking the metallic standard of value, should continue to act on the principle that a pound note can never be depreciated while it continues to be the interest of $\text{£} 33 : 6 : 8$, in the three per cent. stocks, there is no excess nor depreciation of paper, no rise in the price of provisions, no extent of mischief, from which the public can be secure. The forgers of coins, who are whipt or sent to Botany Bay, for what in the cant phrase is called diminishing the scarcity of half crowns, would be harmless, compared to the diminishers of the scarcity of paper, who should carry this principle into full practice.

The committee conclude their report, by suggesting, that the restriction on cash payments cannot safely be removed at an earlier period than two years. Adverting to the circumstance, that as the law stands at present, the bank would be compelled to pay in cash at the end of six months after the ratification of peace; but the committee are of opinion, that if peace were to be immediately ratified, it would be hazardous and impracticable immediately to enforce the standing law. Two years they think ought to be given in the event of peace, but not more, though the war should continue so long. Those who have exhorted most strongly to the repeal of the restriction bill, have not denied, that, exclusive of the clamours which would arise from those who are selfishly interested in the profits of the bank, the return to a better system must be made with caution. The remedy of the evil is acknowledged to require caution by those who most strongly advise it. Mr Blake himself expresses a doubt, whether the legislature may not be under the necessity of receiving, rather than proposing conditions. Such an influence have the directors acquired, not merely over the finances of individuals, but of government itself, that at one time they extorted a promise from the prime minister (Mr Pitt), that no future loan or advances to the emperor should be resolved on, without previous communication with them. On this occasion they controuled the minister in the most important of political operations, to protect themselves from an embarrassment brought on by themselves, by their imprudent advances to government. Among the remedies proposed, by those who have written on the subject, it has been suggested, to oblige the directors every successive half year, to diminish the average quantity of their notes in circulation by half a million, and to continue this diminution till the market price of bullion be restored to its mint price; then the resumption of cash payments might take place without the dangers apprehended from a sudden diminution of the currency. Another plan has been advised, viz. to begin the remedy by obliging the bank to pay a small percentage upon its notes, at the option of the holder, and increasing this percentage gradually.

The expediency of establishing a new chartered bank has been also suggested, with much appearance of propriety. The power of the bank, to be responsible in specie for all their notes at present in circulation, seems to be more than doubtful. Their attempt to make cash payments if it failed, might produce very serious consequences, both to public and private credit. Nor does

it appear to be an unfounded suspicion, (if we may judge from the language of the bank directors and their advocates,) that sooner than submit to the injunction of government, (were it enforced at the end of two years,) to resume cash payments, they would employ the interim in making still larger issues of paper, and thus protect themselves from being called to attempt what would thus become notoriously impossible. The establishment of this new chartered bank, would not only defeat such a purpose, if it were cherished, but it would be compatible with the greatest caution, in proceeding with regard to the repeal of the restriction bill. The provisions of that bill might be extended to both corporations, so long as it might be thought expedient to continue the act in force; and daily or weekly payments might be directed to be made between the two banks for the balance of their respective notes in each others hands, either in specie or in bullion, at the mint price. This injunction, and a clause forbidding any person concerned in the one bank from being concerned in the other, would preserve a competition between them, and prevent their forming any combination against the other for their mutual advantage. Although it is evident, that the proprietors in such a new undertaking, would act under one disadvantage in the first instance, that they would be obliged to pay interest to the Bank of England for the notes in which they subscribed their capital; yet if the legislature patronized the New Company, this disadvantage could be soon overcome, and would be readily subscribed to.

By what we hear and read on this subject, the project of a new bank seems to be the remedy most likely to be tried in the present crisis.*

The combined British and Portuguese army, which had taken up a line of positions on the eastern frontier of Portugal, towards the close of 1809, continued stationary in the early part of the following year. A division of this army under Major General Hill, occupied the frontier line to the south of the Tagus, while the main body extended from the right bank of that river to the Douro. The fortress of Almeida was garrisoned chiefly by the Portuguese militia, under a British governor, Major General Cox; the light troops and some cavalry, under Brigadier General Crawford, were advanced in front of that fortress, and patroled as far as Ciudad Rodrigo in Spain. In the mean time, the French, consisting of three corps, under Ney, Junot, and Regnier, and commanded by Marshal Massena, were assembling at Salamanca, and on the frontiers of Portugal. Their numbers most probably amounted to 80,000 men. The allied army, when concentrated, did not exceed 60,000, exclusive of the Portuguese militia and ordenença, the greater part of which were in the northern provinces with General Francisco de Silveira, and at Oporto and Coimbra with Colonels Trant and Millar.

The campaign of 1810 commenced with the siege of Ciudad Rodrigo, by two corps of the French army, which invested the place on the 11th of June. On the night between the 15th and 16th the trenches were opened, and in a few days the second parallel was completed.

On the 25th at night, the besiegers opened their fire, and on the 10th of July the place surrendered. However valuable the place might be, as an advanced post to the allies, Lord Wellington did not judge it a sufficient object to risk a general action for its relief. Of his Portuguese troops, composing nearly one half of his army, Lord Wellington had not sufficient experience to be assured of their steadiness,—the enemy was besides superior in cavalry, and the scene of action must have been upon plain ground. After the fall of Ciudad Rodrigo, the light division under General Crawford, consisting of nearly 5000 men, remained between that place and Almeida. On the morning of the 24th of July, they were attacked by a corps of the enemy greatly superior in numbers, which obliged them, after a gallant defence, to retreat from their position across the bridge of the Coa. On the retreat of this advanced corps, the fortress of Almeida was completely invested, and the same day was summoned by General Loison to surrender. On the 15th of August the enemy's trenches were opened; in nine days, the second parallel was opened within 150 toises of the place, and on the morning of the 26th the hostile fire commenced from 65 pieces of cannon, which was returned from the fortress till four in the afternoon. At seven, the principal magazine in the castle and two smaller ones exploded, by which the ramparts were greatly injured, the ammunition was lost, and 500 soldiers killed. Finding resistance unavailing, governor Cox surrendered the fortress on the night of the 27th.

In the interval between the commencement of the siege of Ciudad Rodrigo and the fall of Almeida, the corps of General Regnier (the left wing of the French,) was stationed on the frontiers of Spanish Estremadura, to the south of the Tagus, and was held in check by the division of General Hill, which occupied Portalegre, Elvas, and the frontier line of Alentejo. On the surrender of Almeida, Regnier crossed the Tagus with the view of turning Lord Wellington's right flank, and occupying the road to Lisbon by Castello Branco. This movement General Hill was able to anticipate, and crossing the Tagus at Villa Velha, possessed himself of the important road at that place. On the 16th of September, the French army broke up from Almeida, taking the direction of Guarda and Celerico; afterwards crossing the Mondego by the bridge of Fornos, the three corps of Ney, Junot, and Regnier, under their commander in chief, united on the 21st at Vizeu, where they halted for two days to bring up their artillery, which had been delayed by the badness of the road. Colonel Trant, who commanded a body of Portuguese militia and ordenença, attacked an escort of the reserve artillery, and made some prisoners, but was obliged to retire towards the Douro. The British cavalry, under General Cotton at Celerico, withdrew from that place, following the route of the combined army, which had retired by the Val de Mondego to the position of the Sierra de Marcella, behind the river Alva. The enemy pushed on his advanced guard from Vizeu on the 21st, as far as Santa Comba Dao, at the junction of the

* This measure, Mr Marryat (in his *Thoughts on the establishment of a New Chartered Bank*), observes, is not open to the objections that have been urged against putting specie into general circulation in the present state of things, that the little which we have left would immediately be sent out of the country, and that we should be obliged to revert to paper currency, after having destroyed its credit; while at the same time it appears more likely, that excess would be checked, if the circulating medium of the metropolis, instead of consisting wholly of the notes of one establishment, (on whose issues there is no controul,) consisted of the paper of two establishments, both whose issues were controuled by the necessity of settling with each other in a common medium, and the check given to their paper would be felt by all the subordinate banks throughout the kingdom.

rivers Criz and Dao. Brigadier General Pack, who had been stationed at this point with his brigade, after destroying the bridges over these rivers, retired across the Criz, and joined General Crawford at Mortagao. On the 25th the enemy crossed the Criz with two corps of his army; Generals Crawford and Pack retreated to the position of the Sierra de Busaco. As it appeared that the intention of the enemy was to force this position, and by that means to possess himself of Coimbra, Lord Wellington made a movement to his left, crossing the Mondego with the whole of his force, except one brigade of British which he left to cover his right flank, and a division of British and Portuguese cavalry which remained in front of the Alva, to keep the enemy's cavalry in check.

At six in the morning of the 27th of September, the enemy made two attacks on the position of our whole army, the one on the right, the other on the left, of the highest point of the Sierra de Busaco. They were repulsed in both quarters. The loss of the allies in killed, wounded, and missing, was above 1200. The loss of the enemy in killed, wounded, and prisoners, was computed in our reports at 10,000. The French gave it out at 11,000; and by our own account, the prisoners whom we took did not exceed 386. The French also tell us that their whole army was not engaged, but only two brigades of it; and that, in fact, they amused Lord Wellington with this portion of their army, while they came round with their main force to get between his rear and Lisbon. The immediate consequences of this victory at Busaco, which was announced by the firing of the Park and Tower guns, by no means confuted this last assertion of the enemy.

Massena did not renew his attack on the 28th, except by "*the fire of his light troops*;" but he moved a large body in such a direction, as induced his lordship to withdraw from the mountains of Busaco, and to take his army in a southern direction, that is to say, nearer to Lisbon, to his strong holds, his shipping, and his reinforcements. His lordship adds in the same dispatch, that the enemy's communication with Almeida was cut off, and that Massena possessed only the ground on which he stood. The Spaniards, too, according to Lord Wellington's dispatches, dated Coimbra, 30th of September, were collecting an army of 20,000 men in the north; and the armed peasantry, with the Portuguese regulars, under Colonels Millar and Trant, were operating on Massena's communication, whose men were deserting by hundreds, and dying of hunger. These were cheering statements. Nevertheless it appeared, by his lordship's dispatches, dated the 6th of October, that our army had retired gradually, first to Pombal, next to Leyria, and next to Alcobaça, having skirmished daily with the French, during this retreat of 70 miles, in the space of six days. The retreat of the combined army drew after it the whole of the enemy's disposable force, except such as were left to guard the sick and wounded at Coimbra. Colonel Trant finding his communication with the combined army cut off, retired in the direction of Mialhada, where he expected to have been joined by the corps of militia and ordenença, under General Millar and Col. Wilson; but finding that these corps were delayed in the vicinity of Busaco for want of supplies, he formed the resolution of advancing alone, in order to dislodge the French who remained at Coimbra. Reaching that place with a slight resistance from straggling parties of the enemy, he made prisoners to

the number of 5000, principally sick and wounded, and captured between three and four thousand muskets.

Lord Wellington took up his first line of defence, after his long retreat from Busaco, in a strong position between Alhandra and Torres Vedras. From this position he afterwards retired, throwing back his left flank by Mafra, and occupying a range of mountains which extend from Alhandra to the coast near Mafra. In this position the passes of Bucellas, Cabeça de Maritachique, and Mafra, are the principal features of the country; and through each of these points a road leads from Torres Vedras to Lisbon. These passes are extremely strong by nature, and were further strengthened by redoubts and batteries. The right of his position was covered by the Tagus, and a number of gun-boats were stationed on that river, for the purpose of annoying the enemy if he should make an assault in that direction. The enemy remained inactive in front of this position for the space of a month, his right being on Sobral, and his left flank at Villa Franca. Abrantes and Peniche, in his rear, were garrisoned chiefly by the Portuguese militia, which, on several occasions, intercepted his foraging parties, and took some prisoners. Lord Wellington was joined, a short time after he had taken up his line of defence, by a Spanish corps of about 9500 men under the Marquis de Romana. In this state the contending armies continued until the 14th of November, when Marshal Massena retired from his right, by the road of Alemquer towards Alcoeire, and from his left by Villa Nova, continuing his retreat to Santarem, where he halted and took post. The allied army broke up from its position on the morning of the 15th, following the march of the enemy as far as Cartaxo, where Lord Wellington established his headquarters. In these movements about 400 prisoners were taken from the enemy. General Hill's corps, at the same time, passed in boats across the Tagus at Valada. By this retreat, Massena secured the passage of the Zezere; the power of withdrawing into Spain by the line of Castello Branco; a junction with his expected reinforcements; and a country not yet exhausted, which afforded support to his army. The allies had clearly retained, at the end of the campaign, a position which the French could not force, at least in the present circumstances; when the winter rains had set in, to which the French, if they had not retreated, would have been exposed without shelter, in a country which afforded no supplies, while the allies were securely huddled, and obtained supplies of provisions by sea. A desultory resistance to the French was kept up in several parts of Spain, throughout the provinces of Arragon, Catalonia, Valencia, and Murcia; but the enemy crossed the Sierra Morena once more without opposition, and pushed on their conquests to the isle of Leon.

An unfortunate attempt was made by the British, in the month of October, to make a diversion on the Spanish coast. The object of the enterprise was to take the castle of Fuengirola, and afterwards to drive the French out of Malaga. Lord Blaney sailed for this purpose with 300 British soldiers, 400 foreign deserters, and the Spanish regiment of Toledo. After a vain attempt to effect a breach in the fortress with some gun boats and field pieces, the assailants were surrounded by a superior force, the foreign deserters went over to the enemy, and a retreat was with difficulty effected, by the aid of the flank companies of the 82d regiment, who arrived to assist in covering it. The blame of the expedition

was ungenerously ascribed, by some of the courtly newspapers, to Lord Blaney's perseverance in attacking the castle of Fuengelora. The truth is, that the force sent upon the enterprise was utterly inadequate to the object; and such an apology, affecting the name of a gallant officer, wounded and a prisoner in the hands of the enemy, could only be devised by those who were interested in covering the true causes of its failure.

The year was distinguished by colonial conquests, both in the East and West Indies. An expedition sailed from Martinique, against Guadaloupe, on the 24th of January, under the command of Admiral Cochrane and General Beckwith. General Ernouf, the French governor of the invaded island, had been apprised of the intended attack, and had concentrated all his force at Basse Terre. The first division of the British, under the commander-in-chief, landed at the village of St Mary, and soon after advanced towards Trois Rivières; the second division landed to the north of Basse Terre, under General Harcourt. After some skirmishes, a general engagement took place on the 23d of February, in which the French were defeated with the loss of 500 men. In the evening of the same day, the reserve, under General Wade, (who appears to have acted with uncommon skill and activity in getting at the enemy, by a route less than half the distance of the intended one, and whose conduct seems to have decided the success of the enterprise,) turned and beat the enemy's left in the mountains. Ernouf's position became so critical, that on the 24th of February, he hoisted flags of truce, whilst our troops were advancing. Next morning commissioners were appointed on both sides, and a capitulation was agreed upon, by which the garrison were to have the honours of war, and to be sent to England as prisoners of war until regularly exchanged. This service was performed in the space of eight days, with the loss of less than 300 killed and wounded, and deprived the enemy of his last West Indian colony.

In the same month, and happily with inconsiderable bloodshed, the rich island of Amboyna, one of the Moluccas, was captured by a squadron of ships, under the command of Captain Tucker. Whilst Captain Tucker cannonaded the enemy's shore, forts, and batteries, from the sea, a selected body of 400 soldiers and seamen were landed, who stormed the batteries, and crossed the precipitous heights that intervened between the shore and town of Amboyna. They then summoned the town to surrender; and the garrison, consisting of 1000 Javanese troops, and 130 Europeans, capitulated to those hardy assailants.

A still more important acquisition was made, in the capture of the island of Napoleon, (lately Bourbon,) in the same quarter of the world, by a squadron of four ships under Captain Rowley, and a force of 3650 European and Indian troops, under Lieutenant Colonel Keating. On the 7th of July, a partial landing was effected; but, owing to the violence of the surf, the remainder of the force was not put on shore till next day, when Colonel Keating pushed on to the attack of the capital, St Denis. Every thing was in readiness, and the assault would have taken place in less than half an hour, when a suspension of arms was demanded by the enemy. A capitulation ensued; and thus, with a trifling loss, a population of 100,000 souls was added to our empire. The enemy, 1500 strong, surrendered prisoners, but were allowed the honours of war. The laws, customs, and property of the inhabitants, were to be insured to them. Our whole loss in the expedition amounted to 97 men.

To these acquisitions was added the island of Banda, which is the principal of a cluster of small islands, lying to the east of the Celebes, in the East Indies. Its inhabitants, with those of its dependent islets, are supposed to contain about five thousand. Their chief produce is nutmegs, of which they yield enough for the supply of the whole world. (See *BANDA*.) Three British frigates arrived off Banda on the 8th of August. At night, the boats, containing 390 men, commanded by Captain Cole, pushed for the shore; but, owing to the tempestuous weather, only 180 reached the appointed rendezvous. After waiting some time for the boats that were missing, they boldly resolved to push ashore. The badness of the weather was now of service, for the boats grounded undiscovered, in a heavy squall of wind and rain, within 100 yards of a battery of ten twenty-four pounders, which was stormed; the sentinel was killed by a pike, and sixty men disarmed without the discharge of a piece. The storming party then proceeded to Fort Belgica. The alarm bugles were then sounding, and the enemy reserved their fire till the British got close to the walls. The scaling ladders were rapidly applied, and mounted with extraordinary celerity, notwithstanding a smart, though ill-directed fire from the citadel. The lower works being gained, the ladders were placed against the inner wall, when the enemy fled in all directions, leaving the commandant and ten men killed, and two captains and 30 men prisoners. The guns near the ladders having been deserted by the cowardice of the enemy, the British found themselves in possession of the citadel, without the loss of a single man. The citadel commanded the town and Fort Nassau. A flag of truce was dispatched to the governor, who at first refused to capitulate; but a shot from Fort Belgica, and a threat of storming the town, produced an immediate and unconditional surrender. Seven hundred disciplined troops, and three hundred militia, grounded their arms to this handful of Britons. About 400,000*l.* worth of spices were found by the victors. But the capture of the Isle of France forms by far the most important feature of success in the year. This place had been a nest for the enemy's marauders, and enabled their privateers to lord it over the seas of India, whilst their greatest navies durst not venture from the harbour in those of Europe. Admiral Bertie commanded the squadron which sailed against this settlement: the army was commanded by General Abercrombie, son of the victor of Egypt.

The armament arrived off the island on the 28th of November. On the following morning, a part of the troops under Major General Warde landed without opposition in the bay of Maypon, the enemy retiring on their approach. Lieutenant Colonel Smith, with his brigade, followed next morning, and gained the open country without much opposition; some shots only having been fired by a small picket, by which a few men were wounded. The army moved forward the next morning, and took up a position about five miles from Port Louis. Falling in with a corps of the enemy in a strong position, with field pieces, our advanced guard, under Colonel Campbell, charged them with the greatest spirit, and compelled them to retire. The next morning, while making dispositions for a general attack, the enemy asked and obtained terms of capitulation. The garrison, naval and military, with their effects and baggage, were to be sent to France, without being considered prisoners of war. The inhabitants were to preserve their laws and religion, and property to be respected. A 52 gun ship, 5 frigates, three 30 gun prison ships, a sloop of 22,

and two brigs of 14 guns, a schooner, and several gun-boats, with 28 merchantmen, were made prizes in the harbour.

In September, the enemy made an abortive attempt on the island of Sicily. At daylight, on the morning of the 18th, a great body of King Joachim's flotilla appeared to be preparing an attempt to land between Messina and the Faro. While their movements engaged the attention of the main body of the British force, a debarkation was effected by a detachment near St Stefano. This corps consisted of 3500 Corsican and Neapolitan troops, who had crossed the straits in forty large boats, and gained the Sicilian shore before the dawn. Upon the first alarm, General Campbell repaired to the menaced quarter, where he found the German riflemen engaged with the enemy, and two other regiments occupying the post of Mili to prevent the advance of the French upon Messina. At day-break, he perceived the enemy already on the heights, and extending from thence to the beach. By a brisk attack, they were speedily put to the rout; and besides a number of killed and wounded, 900 were intercepted in their retreat to the boats, and made prisoners. On the side of the British, only three private soldiers were wounded.

When parliament assembled on the first of November, ministers were obliged to announce very melancholy intelligence respecting the state of his majesty. The houses had been prorogued to that day, and it was known to have been the royal intention to extend the prorogation, but from the king's state of mind, the Lord Chancellor had found it impossible to procure a new signature. The Chancellor of the Exchequer stated that the symptoms of his majesty's disorder were exceedingly mild; that the strongest expectations of his speedy recovery were entertained, and made a motion, which was readily agreed to, that the house should adjourn for a fortnight.

During this first adjournment, the public anxiety was deeply fixed on the daily bulletins respecting the sovereign's health; but, from these vague announces, it was difficult to form an idea of his real situation. General and indistinct as they were, however, and each successively referring to a former one, as vague as the succeeding, they conveyed, upon the whole, an unfavourable expectation.

At the meeting of the 15th, the Chancellor of the Exchequer proposed another adjournment, and carried it in spite of the strong remonstrances of several members of the opposition, who contended that the adjournment ought to be only from day to day, and that it was highly improper during a period of war, expenses, danger, and difficulty, to remain without consulting for the appointment of a new executive.

On the 29th the report of his majesty's physicians was submitted to the House of Commons, as it had been given before the Privy Council. Mr Perceval still holding out hopes of recovery, proposed a third adjournment for a fortnight; declaring, however, that unless at the expiration of that time there was a prospect of speedy convalescence, he should not propose any farther delay to taking parliamentary steps for supplying the deficiency of the regal power. After considerable opposition, the adjournment was carried as proposed.

On the 13th of December, committees were appointed to examine the king's physicians. The examination

took place on the following Monday. All the physicians agreed in confident hopes of his majesty's ultimate recovery; but none of them could predict the probable duration of the malady.

On the 20th of December, the Commons resolved themselves into a committee of the whole House, to consider the state of the nation; when Mr Perceval produced his plan of the regency, of which, the first important feature to be considered, was the appointment of the regency by bill, (not by address to the Prince of Wales,) conformably to the precedent of the proposed regency in 1788. It was a point understood on both sides, that the Prince of Wales was to be the sole regent; but, in the debates which had already taken place, the opposition had taken the same ground as in the former question of the regency in 1788, and proposed the immediate measure of conferring authority on the Prince by address. Mr Perceval, anticipating the arguments for this proposal, contended, that the main objection to the procedure by bill, was equally applicable to the other mode. The house, it had been asserted, could not pass a real bill, because it could not legislate without the concurrence of the king, as well as of the upper house. To proceed by address, he maintained, would still be to legislate. Suppose the house should address his Royal Highness the Prince of Wales to assume authority, What was that authority? It was not the authority of a king, which was clear and distinct—it was that of a regent, which was undefined, and must depend upon circumstances for its limits or extension. But supposing that the office of regent was intelligible, and was defined by law in its rights and duties, What would be the regent's first act after his appointment? The calling together of his majesty's parliament. How could he call them? Would it not be by authorising the individual who happened to be in possession of the great seal, to put that seal to some commission, either authorising the regent himself, in the name of his majesty, to open the parliament, or authorising commissioners appointed by the regent, for that purpose? Not a single legislative act could be accomplished by the regent without the use of the great seal. The houses, it is true, would not directly command the great seal to be used, but they would, even in the procedure by address, authorise an individual to command it to be put. Therefore, the houses would legislate in the one mode of procedure as well as in the other. The gentlemen on the opposite side (Mr Perceval continued) propose to transfer the whole regal authority by a single vote. But provision is to be made for the eventual restoration of his majesty to the exercise of his power when his health shall return; and in no way can the provisions for that resumption, and the restrictions necessary to be laid on the regent, be so well made as in proceeding by bill. The leaders of opposition contended, that the procedure by address excluded no limitation or provision for the king's resumption of authority, which parliament might choose to embody in such an address. "What reason, they asked,* is there for supposing that his Royal Highness will refuse the limitations that shall be judged necessary, because they are stated in an address instead of a bill? Lord Somers, and the most distinguished constitutional patriots, did not think there was any danger in proposing the necessary limitations in an address to the Prince

* Mr Ponsonby's speech on the 20th of December 1810.

of Orange to fill the throne, instead of a bill; and there is no more danger of the Prince of Wales refusing the present offer, than of the Prince of Orange at a former period. The precedent of the proposed regency in 1788, they deprecated as unconstitutional, and distinguishing between restrictions which should fetter the executive in times so full of peril, and the necessary regulations for enabling his majesty to reassume his power at a proper period, they proposed, as an amendment, that his Royal Highness should be immediately addressed to take upon himself the powers of regent.* The present question, we think, might be reduced to two capital points, substantial expediency, and legal or constitutional form. With respect to the first, it was strongly urged, in the present case, as it had been urged twenty years before, that the powers which it is salutary to attach to monarchy, should be equally allowed to the regent as to the actual monarch. The regulations with respect to time, the provisions which shall enable the absent sovereign to return to power, are essentially to be distinguished from limitations of the regal power. If this argument of upholding the executive in equal prerogative during a regency as at other times, had any force in 1788, it had certainly additional force at a crisis of war, danger, and difficulty—a time, too, at which the heir apparent, if ever fit for the exercise of power, was at an unexceptionable age. With respect to the objection of informality being equally applicable to procedure by address as by bill, the arguments of the Chancellor of the Exchequer appear to be sophistical. Parliament, in proceeding by bill, clearly legislates without the third estate; in the procedure by address, they do not. They authorise, indeed, a person to *authorise* the great seal to be used—but that is not using it themselves.

The moment a regent is appointed, a king to all intents and purposes is appointed, and the order of that regent, in the king's name, to use the seal, is not a fiction. It is an exercise of royal authority. The regent is *pro tempore* king. He uses the king's name not as a fiction, but as a reality. He is, in the eye of the law, the king, from the time he has accepted the address. He has a discretionary veto upon the proceedings of parliament. But when parliament proceed by bill, they make themselves *pro tempore* both to the first, and second, and third estate. It is said that the first act of the regent, after being appointed by address, would be signing the king's consent to his own appointment, by desiring the chancellor to affix the great seal to a commission. To this it should be answered, that the substance of royalty has already passed to him, and he signs that consent in the name of the king: but he is already king himself for the time; he is the executive; he puts the executive seal to the consent of the royal power which he himself represents, not to the consent of the afflicted individual, who ceases to be king during the period of his malady. Let us examine the difference between the regent giving assent to the act of parliament which calls him by address, and the act which appoints him by bill. In the latter instance, the bill is passed without any executive power. In the former instance, an executive power, not a dead seal, but an active and real will, a will essentially royal, is created to complete the act of parliament. In defence of the restrictions of the regency; it has been

said, that a temporary regent should not have the power of extending his influence beyond the period of his regency, i. e. by creating peers. By the same argument it should be admitted, that a king should not have the power of creating honours or emoluments which can survive himself. Having carried the point of appointing the regency by bill, the minister proceeded, on the 31st of December, to propose the restrictions to be imposed on the power of the regent. Four resolutions to this effect were carried, by majorities so small on the side of ministers, as to mark an anticipation of their declining. The substance of the first resolution, was the expediency of his Royal Highness the Prince of Wales being appointed regent; of the second, to restrain him from creating a peerage in any case, except as a reward for some important military or naval achievement; of the third, to prevent him from granting any office in reversion, or any office, salary, or premium, except such offices as are by law required to be granted for life, or during good behaviour. The substance of the fourth resolution was, to vest in trustees whatever part of his majesty's property as was not already so vested.

On the first of January 1811, the minister proposed a fifth resolution respecting the royal household, in which he was left in a minority. The resolution, as amended by the opponents of ministry, was, that the care of his majesty's person during his illness should be committed to the queen, together with the sole direction of such portion of his majesty's household, as should be deemed suitable to a due attendance and regard to his royal person.*

The other most important articles of the regency bill were in substance as follows:

Her majesty was to have a council, to assist in the discharge of the trusts committed by the act to her majesty.

Her majesty's council may examine the physicians, and others in attendance on his majesty, upon oath.

Her majesty's council shall meet at stated times, to declare the state of his majesty's health, and transmit a report to the president of the privy council, who shall publish a copy in the London Gazette.

Her majesty and council are eventually to notify his majesty's restoration to health, by instrument sent to the privy council. After such instrument has been received and entered by the privy council, his majesty may, by sign manual, require the privy council to assemble.

If his majesty, by the advice of his privy council, shall signify his royal pleasure to resume the personal exercise of his authority, and require a proclamation to that effect to be issued, the powers of the act shall cease.

In case of the death of the regent, or her majesty, or the resumption of the royal authority by his majesty, parliament, if then adjourned or prorogued, shall meet; or if dissolved, the members of the last parliament shall meet. Members of the two houses so meeting, shall be deemed the two houses of parliament; but not to continue to sit longer than six months.

The election of members is to be declared void, by appointment to office by the regent, or her majesty.

The debates on the bill occupied both houses till the end of the first week of February 1811, at which period

* The original clause moved by Mr Perceval was, that, for a time to be limited, her majesty should have the power to remove and to nominate and appoint such persons as she should think proper, to the several offices in his majesty's household; and to dispose, order, and manage all other matters and things relating to the care of his majesty's royal person, during the time foresaid.

his Royal Highness entered upon his office of regency.

In concluding our view of public affairs at the close of 1810, we regret that we cannot record the termination of our dispute with the states of America. The orders in council, as far back as November 1807, had put an end to all neutral commerce, except by licence from England. By way of retaliation for these new and additional restrictions, Bonaparte issued from Milan, in the December of the same year, his decree, which bears the name of that place; and as the British orders had declared, that they should be continued in force till the Berlin decree was revoked, so this decree from Milan declared, that its restrictions and penalties should remain in force till the orders in council should be revoked. Each of the belligerents informed America (unhappily now the only neutral nation,) that they enforced the measure of retaliation, not from hostility towards her, but in self defence. Each of them desired America to compel their enemy to respect her flag; unless she did so, they declared that they must enforce their retaliation. America protested against the grounds of justification taken up by both parties: she declared that both had violated her rights; but she at last determined to submit, for the present, whilst she endeavoured to prevail upon one party or the other to give way first, and to revoke their orders or decrees. After long and fruitless efforts to this effect, she passed, on the first of May 1810, an act, in which she provided, that if either Great Britain or France should, before the 31st of May 1811, revoke, or modify her edicts so that the neutral commerce of America should be no longer violated, the fact should be declared by the President of the United States by proclamation; and that then, if the other nation should not, in three months from that time, revoke or modify her edicts in like manner, the non-intercourse act should be revived against that nation. On the 5th of August 1810, the French minister for foreign affairs communicated to Mr Armstrong, the American minister at Paris, that the decrees of Berlin and Milan were revoked, and that, from the 1st of November 1810, they would cease to be in force; it being understood that, in consequence of this revocation, the British should revoke their orders in council, and renounce the new principles of blockade which they had attempted to establish. Mr Armstrong having communicated this notification to Mr Pinkney, the American minister in London, the latter wrote, on the 25th of August 1810, to Lord Wellesley, our secretary of state for foreign affairs, informing him of what had been done in France, and at the same time observing, that he took it for granted that the revocation of the British orders in council would follow as a matter of course, and that he hoped to be able to announce to his government that such revocation had taken place. Lord Wellesley's answer was as follows: "I have the honour to acknowledge the receipt of your letter, under date the 25th instant. On the 23d of February 1808, his majesty's minister in America declared to the government of the United States, 'his majesty's earnest desire to see the commerce of the world restored to that freedom which is necessary for its prosperity, and his readiness to abandon the system which had been forced upon him, whenever the enemy should retract the principles which had rendered it necessary. I am commanded by his majesty to repeat that declaration, and to assure you, that, whenever the repeal of the French decrees shall have actual-

ly taken effect, and the commerce of neutral nations shall have been restored to the condition in which it stood previously to the promulgation of those decrees, his majesty will feel the highest satisfaction in relinquishing a system which the conduct of the enemy compelled him to adopt." The Americans were dissatisfied with this answer, because, in an answer to a direct act of the French government, we only gave a conditional promise. In February 1808, our minister in America had declared, in the king's name, to the government of the States, that his Britannic majesty would readily follow the example, in case the Berlin decree should be rescinded, or would proceed *pari passu* with France in relaxing the vigour of our measures. The Americans asked, if this was shewing a readiness to follow the example of France, in restoring to America the enjoyment of what we acknowledged to be her just rights, and only infringed upon by necessity? The motive of our government might, perhaps, be distrust of France; yet, independent of the circumstance of our national faith being pledged to keep pace in retraction with France, we had ourselves very recently held inferior diplomatic communication with France, and trusted to their faith when officially given. In the late negotiations for a cartel, our government even promised to liberate French prisoners, if the French government would certify, that an equal number of English prisoners was liberated in France. It was asked, then, with what consistency we refused to make a direct promise, in return for a French promise, respecting America, whilst we agreed to act by anticipation on the faith of a promise respecting prisoners from that same government? The Americans evidently trusted to the faith of France respecting the revocation of the decrees, and acted upon the promise of the 5th of August, by issuing proclamations to admit French vessels within their waters. It is evident, therefore, from our delaying to retract the orders in council, that we either doubted the faith of the enemy, or were determined to uphold the orders independent of all considerations. The answer of Lord Wellesley certainly was not proceeding *pari passu* with France; and the policy of retracting from our promise to that effect may be questioned, on other grounds than the intrinsic merits of the orders in council. It is a question of good faith, and no consideration of interest ought to stand in the way of that faith being fulfilled.

In consequence of this proceeding, the President of the United States, in November, proclaimed, that the former restrictions of intercourse should cease to exist with regard to the trade of France and her dependencies; and that, if Great Britain should not rescind her orders in council before the 2d of February 1811, the act of non-intercourse should, from that date, be revived, so far as it relates to Britain and her dependencies.

The Spanish campaign of 1811, was distinguished, at its very commencement, by one of the most severe and brilliant engagements that has occurred during the present war. About the end of February, an expedition set sail from Cadiz, under the command of the Spanish general La Pena, and of our gallant countryman, General Graham. It consisted of 3000 British troops, and of 7000 Spaniards. They landed at Algeiras, and moved from Tariffa towards Barbate on the 28th of February, with the view of attacking the enemy's lines before Cadiz. After a night-march of 16 hours, from the camp near Veget, the army arrived, on the morning of the 5th, on the low ridge of Barrosa, about four

miles south of the mouth of the Santi Petri river. The vanguard of the Spanish army, under General Cadizabel, having opened the communication with the Isle de Leon, by a successful attack on the rear of the enemy's line near Santi Petri, General Graham was ordered by La Pena to move down from the position of Barrosa to that of the Torre de Bermesa, about half way to the Santi Petri, for the purpose of securing the communications across the river, over which a bridge had been lately thrown. During his march to the Bermesa, General Granam was informed that the enemy had appeared in force on the plain, and was marching to the heights of Barrosa. In order to support the Spanish troops under La Pena, which were left to defend the heights, the General immediately countermarched; but, before his army was disentangled from the wood, the troops on the Barrosa hill were seen returning from it, while the enemy's left wing was rapidly ascending. The right wing, at the same time, stood on the plain on the edge of the wood, and within cannon-shot. Under these circumstances, a retreat was impracticable; and General Graham determined upon an immediate attack. A powerful battery of ten guns, in the centre, was opened by Major Duncan; and, as soon as the infantry was formed, the guns advanced to a more favourable position, and kept up a most destructive fire. The right wing, under Major-general Dilkes, advanced to the attack of General Ruffin's division on the hill; while Lieutenant-Colonel Barnard's battalion, and Lieutenant-Colonel Bushe's detachment of the 10th Portuguese, were warmly engaged with the enemy's tirailleurs on the left. In spite of the havoc made by Major Duncan's battery, the division of Laval continued to move forward in very imposing masses, opening their fire of musketry, but it was checked by the left wing, which advanced firing; and a determined charge by the three companies of guards, and the 87th regiment, supported by the rest of the wing, decided its defeat. This division was closely pursued beyond a narrow valley, where a body of reserve shared the same fate. The right wing of the British, under General Dilkes, was equally successful. The enemy, confident of success, encountered it on the ascent of the hill, where a most sanguinary contest ensued; but the undaunted perseverance of our troops overcame every obstacle, and succeeded in driving General Ruffin's division from the heights. In less than an hour and a half after the commencement of the action, the enemy were in full retreat; but, having afterwards halted, and evinced a disposition to form, they were quickly dispersed by a new and advanced position of our artillery. During the action, an attempt was made by a corps of French infantry and cavalry to turn the Barrosa height by the sea; but this force was kept in check by General Whittingham with three squadrons of cavalry.

From the exhausted state of the troops, General Graham found it impossible to pursue the enemy; he therefore took a position on the eastern side of the hill. During the whole of this brilliant engagement, the Spanish troops under La Pena, though within a quarter of an hour's ride of the scene of action, remained in a state of total inactivity, and the Spanish general seemed to have been completely ignorant of what was going on in the field. The British division had to struggle alone in this unequal conflict, in which they lost one fourth of their number, and were rendered unable to follow up the victory which had been so dearly won.

Had the Spanish cavalry, with the horse artillery, been rapidly sent by the sea beach to form on the plain, and to envelope the enemy's left, and had the great body of the infantry been marched through the pine wood, in the rear, to turn the enemy's right, he must either have retired instantly, without occasioning any serious loss to the British, or have exposed himself to inevitable destruction.

The troops, under General Graham, amounted only to about 5000, while the French had about 8000 men engaged; but, notwithstanding this disparity of numbers, the loss of the British amounted only to about 200 killed, and 1000 wounded, and that of the French to nearly 3000. An eagle, and six pieces of cannon, and the General of Division Ruffin, the General of Brigade Rousseau, (who afterwards died of his wounds,) and 420 prisoners, were the trophies of this brilliant action. General Bellegard, aid de-camp to Marshal Victor, was killed, and the French Marshal himself is said to have escaped only by the swiftness of his horse.

The personal bravery and military skill of General Graham, which had been so conspicuous in the battle of Barrosa, excited the universal admiration of his countrymen. The thanks of both houses of parliament were unanimously voted for this gallant achievement, with a warmth of feeling which had never been exhibited on any similar occasion; and had not the Prince Regent been fettered by the restrictions upon his office, he would have instantly conferred upon the general some signal mark of his gratitude.

About the beginning of February, the French broke ground before Badajos, on the left bank of the Guadiana, and threw some shells into the town. On the 6th of February, the troops under General Mendizabel entered Badajos, and the fort of St Christoval; and, on the 7th, they made a sortie upon the enemy, by which they obtained possession of one of his batteries; but before they had time to spike the guns, they were obliged to retire, after suffering a loss of about 85 officers, and 500 men killed and wounded. On the night of the 11th, the French carried the redoubt of Pardalleiros, and afterwards constructed a work on the left bank of the Guadiana, to fire upon the bridge of communication with the right bank. In order to keep open the communication between Badajos, and the country on the right bank of the Guadiana, General Mendizabel took a position on the heights of St Christoval, where he was attacked and totally defeated by the French on the 19th February. After crossing the Guadiana and the Evora, the enemy surprised the Spanish army in their camp, and took all their baggage and artillery. On the 9th of March, the enemy made a breach, 18 feet wide, which was not practicable; and, on the same day, General Imaz, the governor, received a message from Lord Wellington, assuring him of succour, and enjoining him to defend the place to the last; but though the garrison amounted to 9000 men, well supplied with ammunition and provisions, it basely surrendered to the French on the 10th of March. "Thus, in the course of two months," says Lord Wellington, "the Spanish nation has lost the fortresses of Tortosa, Olivenza, and Badajos, without any sufficient cause; and, at the same time, Marshal Soult, with a corps of troops which was never supposed to exceed 20,000, besides the capture of the two last places, has made prisoners or destroyed above 22,000 Spanish troops."

On the very day on which the battle of Barrosa was fought, Massena retreated from his position at Santarem; and, on the morning of the 6th, the allied army were in motion to follow him. The enemy marched towards the Mondego, and, on the 12th, their reserve, consisting of the 6th corps, and General Montbrun's cavalry, took up a strong position at the end of a defile, between Redinha and Pombal, with their right in a wood upon the Souvre river, and their left extending towards the high ground above the river of Redinha, and the town in their rear. In this position they were attacked by the 3d and 4th, and light divisions of infantry, and by General Pack's brigade and the cavalry. The post of the enemy in the wood was gallantly forced by the light division, under Sir William Erskine. The troops being now able to form in the plain beyond the defile, Sir Brent Spencer led the line against the enemy's position on the heights, from which they were driven with great loss. The French again took a position upon the heights, on the other side of the Redinha; but the 3d division crossed over by the bridge and ford, which were commanded by the enemy's cannon, and drove them upon their main body at Condeixa. After being dislodged from Condeixa on the 13th, they formed in a very strong position near Cazel Nova, from which they could only be dislodged by movements on their flank; these movements, executed in a masterly manner, obliged them to abandon all the positions which they successively took in the mountains, with a considerable loss of killed, wounded, and prisoners. On the 15th, the enemy again formed on the river Ceira, but this position was also abandoned after much hard fighting. Numbers of the enemy were drowned in attempting to cross the Ceira, and a great deal of baggage, and ammunition carriages, fell into the hands of the allies. From the Sierra de Morta, where the French again made a stand, they were driven, on the 19th, with the loss of 600 prisoners, their left retiring by Gouvea, through the mountains upon Guarda, and the remainder of the army by the high road upon Celerico. On the 3d of April, several sharp actions were fought between the allied army and the enemy's left, in which the latter were uniformly beaten. In consequence of a storm of rain, which darkened the atmosphere, the 43d, 52d, and 95th regiments were unexpectedly involved in a desperate conflict with the main body of the French, which they intended to turn. They succeeded, however, in repulsing the enemy, and in taking one howitzer, and 200 prisoners. On the 8th, the last troops of the enemy crossed the Agueda, and on the 9th, the allied army was in the vicinity of Almeida, on the left bank of the Agueda, with their head quarters at Villa Formosa.

During the whole of this retreat, the French Marshal displayed the most consummate skill. He brought off his troops in one solid mass, covering their rear in every march by the operations of one or two corps d'armée, which availed themselves of the strong positions of the country, and were always closely supported by the main body. The loss of the French in killed, wounded, and prisoners, since the commencement of their retreat, has been computed at 7000. The cruelties which they committed against the inhabitants during the whole of their march, are unexampled in the history of modern war. They burnt the towns and villages through which they passed. The convent of Alcobaca was burnt by an order from the French head-

quarters, and the whole town of Leyria shared the same fate.

Lord Wellington having made arrangements for the blockade of Almeida, left the command of his army to sir Brent Spencer, and proceeded to the army under sir W. Beresford, to make arrangements with that officer, for carrying on the operations in the south of Portugal. After remaining some time in Estremadura, lord Wellington received intelligence from sir Brent Spencer, that the enemy were increasing their force on the Agueda, and returned to his army on the 28th. On the 23d and 27th, Massena attacked the picquets of the allies on the Agueda, but was repulsed with loss. On the 12th of May, he collected a large force at Ciudad Rodrigo, and, on the following day, the whole of the French army recrossed the Agueda. On the afternoon of the third, they attacked, with a large force, the village of Fuentes de Honor, which was bravely defended by several battalions of light infantry. Perceiving the repeated efforts which were made by the enemy to obtain possession of this village, and the vast advantages which they would derive from it in their subsequent operations, lord Wellington reinforced it successively with the 71st, 79th, and 24th regiments. Colonel Cadogan, at the head of the 71st regiment, charged the enemy, and drove them from the part of the village of which they had obtained a momentary possession; and when night put an end to the contest, the whole of the village remained in our possession. On the morning of the 5th, the 8th corps of the enemy having obliged general Houston to retire with some loss, established themselves in Poya Velho, while their cavalry turned the right of the 7th division, between Poya Velho and Nave d'Aver. The charge of the advanced guard of the enemy's cavalry was repulsed by three squadrons of British dragoons, and colonel La Motte, of the 18th chasseurs, and some prisoners were taken. The principal exertions of the enemy, however, were directed against Fuentes de Honor; and though the whole of the 6th corps was, at different periods of the day, employed in the attack of this village, they were never able to gain more than a temporary possession of it. The contest in this quarter lasted till night, when the British troops maintained their post.

On the 7th the French army began to retreat, and on the 10th they crossed the Agueda; having completely failed in their attempt to relieve Almeida. In the actions on the 3d and 5th, the French sustained a loss of nearly 7000 in killed, wounded, and prisoners. In the village of Fuentes de Honor, they left 400 of their dead. The loss of the allies amounted to 184 killed, 1576 wounded, and 316 missing.

In the south of Portugal, the army of general Beresford was equally successful. Olivenza surrendered at discretion on the 15th of April, and measures were immediately taken for the siege of Badajos. On the 10th of May, however, Soult advanced from Seville with a force of about 18,000, and was joined in Estremadura by 5000 troops, under general Latour Maubourg. The united armies of Castanos and sir W. Beresford, who had judged it prudent to raise the siege of Badajos, took up a position in two lines nearly parallel to the rivulet of Albuera. General Blake, hearing of the advance of Soult, joined the allied army on the morning of the 16th; and a few hours afterwards the French army began their march.

At nine o'clock in the morning, the enemy attacked the Spanish troops, who, after a gallant resistance, were driven from the heights on which they had been formed. In the mean time, the division of the Hon. major-general W. Stewart, which had been brought up to support them, and that of major-general Hamilton, which came to the left of the Spanish line, formed in contiguous close columns of battalions, in order to be moveable in any direction. Brigadier-general Otway, at the head of the Portuguese cavalry, remained at some distance on the left of this, to check any attempt of the enemy below the village.

As the heights from which the Spanish troops had been driven, raked and commanded the whole position of the allied army, the division of general Stewart made a noble effort to retake them from the enemy. Lieutenant-colonel Colborne, at the head of the right brigade of general Stewart's division, first came into action, but finding that the column of the enemy could not be shaken by fire, he proceeded to attack it with the bayonet. While the troops were in the very act of charging the enemy, a body of cavalry called the Polish lancers, who had been concealed by the thickness of the atmosphere and the nature of the ground, and who were mistaken for Spaniards when they were discovered, suddenly attacked and turned the brigade, which was unfortunately broken, and sustained immense loss. The 31st regiment, under major L'Estrange, having alone escaped this charge, kept its ground till the arrival of the third brigade under major-general Houghton, who gallantly attacked the enemy, and fell, pierced with wounds, while he was cheering on his brigade to the charge. Though the enemy's attack was chiefly directed to this point of the right, he likewise made continual efforts against the part of the original front of the allies, at the village and the bridge, which were defended by Major-General Baron Alten, and the light infantry brigade of the German legion. The front now formed the left; and Major-General Hamilton's division, which had been brought up there, was left to defend it, with the assistance of a considerable proportion of Spanish troops. While the enemy's infantry attempted to force the right of the allies, their cavalry endeavoured to turn it; but all their efforts were baffled by the able manœuvres of Major-General the Honourable William Lumley, who commanded the allied cavalry. Major-General Cole, perceiving the attack of the enemy, brought up his left, marched in line to attack the left of the enemy, and contributed, with the charges of the brigades of General Stewart's division, to force the enemy precipitately from his situation, to take refuge under his reserve. The allies pursued the French to a considerable distance, and drove them across the Albuera.

At the beginning of the engagement, a heavy storm of rain came on, which, along with the smoke from the firing, rendered it impossible to see any thing distinctly. From this obscurity the French derived great advantage, both in the formation of their columns, and in their subsequent attack.

During the whole of this well-contested battle, which lasted from nine in the morning till two in the afternoon, the skill and courage of the British troops were eminently displayed. The dead of the 57th regiment were lying as they fought, in ranks, and every wound was in the front of their bodies. The loss of the French has been estimated at 8000, while that of the allies did not exceed, in killed, wounded, and missing, 5686.

VOL. IV. PART II.

Soult, with the remainder of his army, retreated to Llerena, where he received great reinforcements from different parts of Spain, and was afterwards joined by the army under Marmont.

After the battle of Fuentes de Honor, the allies resumed the blockade of Almeida. The commander of the garrison, General Brennier, perceiving that it was in vain to defend the place, conceived the hazardous design of evacuating it during the night, and carried his resolution into effect with the most consummate skill. In order to deceive the blockading army, he continued for several nights to fire cannon occasionally from the fortifications. After destroying all the ordnance, he set fire to the mines which had been constructed for blowing up the works, and at one o'clock in the morning of the 11th, he marched out with his garrison; and cutting his way through the picquets by which the place was observed, he joined the army of Massena, in the vicinity of Ciudad Rodrigo. A considerable part of the garrison was lost in this bold enterprise, and the rest were saved in consequence of the 4th regiment mistaking the road to Barba del Puerco. On the evening of the 7th of May, there was a very heavy fire of cannon from the fort, and the picquets were attacked. The same thing happened on the 8th, so that the blockading troops, and the queen's regiment in particular, ascribed the explosion on the 11th to the same cause from which it had arisen on the preceding night. In consequence of this mistake, none of the troops moved till the real cause of the explosion was ascertained.

Leaving Sir Brent Spencer in the command of the army of Almeida, Lord Wellington took the command of the allies before Badajos, on the 22d of May. On the 25th, the place was invested on the right of the Guadiana, and the ordnance and stores being brought up for the siege, the allies broke ground on the evening of the 29th. The fire commenced on the 2d of June, from four batteries; and on the night of the 6th, two breaches in the walls of the Fort St Christoval appeared to be practicable. A detachment of the 85th regiment, under Major Mackintosh, moved forward in the best order, and with the utmost intrepidity, under a heavy fire of musquetry and hand-grenades from the outworks, and of shot and shells from the town, the advanced guard being led by Ensign Dyas of the 51st regiment; but when they arrived at the bottom of the breach, they saw that the enemy had cleared the rubbish from the bottom of the escarp, and though provided with ladders, they found it impossible to mount it, and were obliged to retire with loss. Another attempt to storm the outwork of St Christoval was made on the 9th, but though conducted with the same gallantry, the storming party were unable to mount the breach, and were obliged to retire with considerable loss. In these two attempts the allies lost about 300 men.

On the 10th of May, Lord Wellington having received information that Soult was collecting a force for the purpose of again advancing upon his position, and that the army of Marmont had broke up from Ciudad Rodrigo to join that of Soult, raised the siege of Badajos. He crossed the Guadiana with his whole army, and encamped in the woods, upon the Laver between Quinta de St Joao and Arronches, where he was afterwards joined by the army under Sir Brent Spencer.

In other parts of Spain, the patriots were not equally fortunate. The death of the Marquis de la Romana was a severe loss to the Spaniards. On the 1st of Ja-

4 U

uary 1811, Tortosa surrendered to Marshal Macdonald, after 13 days open trenches; and the garrison, consisting of 9500, laid down their arms, and were made prisoners of war. Tarragona, after a month's siege, surrendered to Marshal Suchet. Cherishing constant hopes of relief, the Spanish garrison maintained a brave resistance, and made several destructive sorties against the besiegers. The place, however, was taken by assault, on the 29th of June, and the people, as well as the brave garrison, were treated with unexampled cruelty. Four thousand men were killed in the city; 1000, who endeavoured to save themselves behind the walls, were either sabred or drowned; and nearly 10,000, of whom 500 were officers, were taken prisoners, and sent to France. The junta of Tarragona escaped to the monastery of Montserrat, the fortifications of which had been deemed impregnable; but Suchet, following up his success, likewise made himself master of Montserrat, on the 24th of July.

About the beginning of August, the army of Lord Wellington marched from its cantonments on the Alentejo towards the north of Portugal, and took up a fresh position, nearly on the ground which it occupied before the battle of Fuentes de Honor.

With the view of relieving Ciudad Rodrigo, the enemy commenced their movements on the 21st of September. On the 23d, they appeared on the plain near Ciudad Rodrigo, but again retired. On the 24th, they entered the plain in considerable force, and on the morning of the 25th, a body of their cavalry drove in the British posts on the right of the Azara, but, having passed that river, they were compelled to recross it by a body of the 14th and 16th light dragoons.

The enemy's attention was principally directed to the position of the third division, on the hills between Fuente Guinaldo and Pastores. Their attempts to gain that position were repulsed with great gallantry; but on the arrival of a division of French infantry, Lord Wellington judged it prudent to retire, and the army, formed into squares, retreated in good order to Fuente Guinaldo. On the evening of the 25th, and on the 26th, the enemy collected their whole force in front of the allied army; but Lord Wellington thought it advisable to retreat, and on the 28th, he formed his army on the heights behind Soito, having the Sierra das Mefas on his right, and his left at Renda, on the Coa.

Marshal Suchet, with 20,000 men, entered the kingdom of Valencia from Tortosa, and laid siege to the strong fortress of Murviedro, the ancient Saguntum. On the 29th of September, he made three attempts to obtain possession of the fort by escalade, but in all of them he was repulsed with great loss, and obliged to leave his ladders behind. In the mean time, General Blake, who had taken the command of the armies of Murcia and Valencia, assembled troops from every quarter, and gave battle to Suchet on the 25th of October, with a view of relieving Murviedro. The Spaniards fought with the greatest gallantry, and several times outflanked and drove the French from their position; but the decisive manœuvre of penetrating their centre, was successfully practised by Suchet, and Blake was obliged to fly after an engagement of seven hours, in which he lost about 6500 in killed, wounded, and prisoners. The result of this victory was the capitulation

of Murviedro, the garrison of which marched out through the breach on the 27th of October, with all the honours of war. The prisoners who thus fell into the hands of the French, with those taken at the battle of the 25th, amounted to 7211, of whom 369 were officers.

The operations of the allied army in the north of Portugal were attended with more success. General Hill left his cantonments near Portalegre, on the 22d of October, and advanced towards the Spanish frontier. When he arrived at Albuquerque, on the 23d, he learned that the French troops under the command of General Girard, amounting to 2500 infantry, and 600 cavalry, had retired upon Merida; and, after following them for four days, he had every reason to believe that Girard was not only in total ignorance of the approach of the British troops, but was completely off his guard. The main body of the French had halted at Arroyo del Molino, on the evening of the 27th, and General Hill resolved either to surprise the enemy, or bring him to action before he should march in the morning. By a forced march, on the evening of the 27th, the British troops reached Alcuesca, within a league of Arroyo del Molino, and at 2 o'clock on the morning of the 28th, they marched in one column upon that town. When they had arrived within half a mile of the town, the British troops divided into three columns, under cover of a low ridge, and the subsequent movements of these columns were concealed by a violent storm of rain and mist, which came on at the dawn of day. The left column marched directly upon the town, the right column broke off to turn the enemy's left, and the third column, consisting of the cavalry, moved between the other two. The 71st and 92d regiments charged into the town with cheers, and drove the enemy at the point of the bayonet. The French infantry, which was out of the town, formed into two squares, with their cavalry on their left; but being unable to withstand the charges of the British cavalry, and the well-directed fire of their musketry, they dispersed, and endeavoured to escape by ascending the mountain behind the town. Their cavalry fled in every direction; the infantry threw away their arms, and being pursued over the rocks by the troops under Major-General Howard, more than 1400 were made prisoners, and 600 were found dead in the woods and mountains. The general of cavalry, Brune, and the colonel of cavalry, Prince D'Armberg, with many officers, were among the prisoners, while General Girard himself, who was wounded in the engagement, escaped to Llerena, with only two or three hundred men.

The campaign of 1811 was not distinguished by any other events of importance. Lord Wellington had his head quarters at Frenada during the remainder of the year, while the division under General Hill was stationed at Merida.

The Regency Bill having passed the great seal, his Royal Highness the Prince of Wales was sworn into his office on the 6th of February. The sanguine hopes which were at this time entertained of the king's recovery, and the fear of taking any measure which might in the least degree interfere with that desirable event, induced the Prince Regent to carry on the executive government by the same ministers that had been appointed by his royal father. He accordingly communicated this resolution to Mr Perceval;* and, on the 12th

* "The prince feels it incumbent upon him, at this precise juncture, to communicate to Mr Perceval his intention not to remove from their stations those whom he finds there as his majesty's official servants. At the same time, the prince owes it to the truth and

of February, the session of parliament was opened by a speech from the Prince Regent, which was delivered by commission. The speech congratulated parliament on the capture of the islands of Bourbon and Amboyna; on the repulse of the enemy's attacks on Sicily, and on the skill, the prudence, and perseverance displayed by Lord Wellington throughout the whole of the Spanish campaign. The Regent called upon parliament to continue the most effectual assistance to the brave natives of the peninsula, in the support of a contest which they have manifested a disposition to maintain with unabated perseverance; and expresses his persuasion, that the best interests of the British empire must be deeply affected in the issue of a contest in which the liberties and independence of the Spanish and Portuguese nations entirely depend. In alluding to the discussions respecting America, the Prince Regent expresses his earnest wish that they may be brought to an amicable termination, consistent with the rights and interests of the united kingdom. The revenue of Ireland is stated in the speech to have suffered a considerable diminution, while that of Great Britain during the year 1810, was greater than had been known in any preceding year.

The conduct of the Irish Catholics was one of the principal subjects which occupied the attention of parliament at the beginning of the session. The Roman Catholics in the different counties of Ireland, were summoned to hold a meeting for the purpose of electing delegates to sit in the Catholic committee which was formed in Dublin, in order to promote the great object of Catholic emancipation. The Lord Lieutenant considering these meetings as illegal, and as injurious to the tranquillity of the country, issued a circular letter to the sheriffs and chief magistrates of the counties, "requiring them, in pursuance of the provisions of an act of the king, cap. 29, to cause to be arrested, and to commit to prison, all persons within their jurisdiction, who shall be guilty of giving or having given, of publishing or having published, or of causing or having caused to be given or published, any written or other notice of the election and appointment, in any matter of such representative, delegate, or manager as aforesaid; or of attending, voting, or acting, or of having attended, voted, or acted, in any manner, in the choice or appointment of such representative, delegate, or manager."

This circular letter, which was issued without the previous approbation, or even knowledge, of the Prince Regent or his ministers, excited great dissatisfaction among the Catholics in Ireland, as well as among their friends in England. Lord Moira, in the House of Peers, reprobated such a measure, as injurious to the character of the Prince Regent, as dangerous to the peace of the country, and as contrary to the act of Union. The Earl of Ross contended, that as long as the Catholic committee confined its attention to the object for which they were avowedly appointed, the Irish government did not interfere; but that when the regular business of the committee was over, it proceeded to the

most alarming lengths. The committee, he stated, consisted originally, of 38 members; and they had lately determined, that each county of Ireland should send ten members to the committee, which would then consist of no fewer than 358, a convention which he considered highly dangerous to the tranquillity of Ireland.

On the 7th of March, the subject was brought regularly before the House of Commons, when the Honourable Mr Wellesley Pole, the Irish secretary, was present. The assembly, said Mr Ponsonby, which had been described in the circular letter as an unlawful meeting, had been for many years in existence, and in the habit of meeting to promote the object for which it had been appointed: nay, it had actually taken measures for augmenting its number, twenty-four days before the promulgation of the circular letter. What, then, was the reason why this assembly had been so long suffered to continue its proceedings, without any interference on the part of government? With respect to the convention act, in which the circular letter was printed, it had never been put in force. Even by the act itself, the mere publishing of notices was not an offence; for it expressly declares, that, in order to commit the offence, a man must be guilty of voting, as well as of attending; whereas the circular letter required that all who attended might be arrested. In reply to these observations, Mr Pole stated, that no obstruction would have been given to the proceedings of the Catholic committee, while they met solely for the purpose of petitioning; that, at the committee of 1810, the most violent and inflammatory speeches were delivered, in which the English government were represented as hostile to Ireland and its Catholic inhabitants; and that a sub-committee had been appointed to enquire into the grievances which the Catholics had suffered from a bigotted government. Mr Pole enumerated many other instances, in which he thought the Catholic committee had gone beyond the object for which they were appointed, and which he considered as sufficient grounds for enforcing the convention act.

On the ninth of July, a meeting of the Catholics of Ireland was held in Dublin, and a series of resolutions were passed relative to the measures which were thought necessary for obtaining signatures to their petition from all parts of Ireland, and for bringing it before both houses of parliament. In consequence of this meeting, the Irish government issued a proclamation, declaring all such meetings illegal, and ordering the sheriffs and magistrates to disperse them in terms of the convention act.

No sooner was this proclamation issued, than an extraordinary meeting of the Catholic committee was held in Dublin, at which they determined to continue their meetings for the purpose of electing delegates to the committee. These meetings, which were held in several of the parishes of Dublin, experienced no interruption till the 8th of August, when several Catholic gentlemen were arrested under a warrant from the Lord

sincerity of character, which, he trusts, will appear in every action of his life, in whatever situation placed, explicitly to declare, that the irresistible impulse of filial duty and affection to his beloved and afflicted father, leads him to dread, that any act of the regent might, in the smallest degree, have the effect of interfering with the progress of his sovereign's recovery. This consideration alone dictates the decision now communicated to Mr Perceval. Having thus performed an act of indispensable duty, from a just sense of what is due to his own consistency and honour, the prince has only to add, that among the many blessings to be derived from his majesty's restoration to health, and to the personal exercise of his royal functions, it will not, in the prince's estimation, be the least, that that fortunate event will at once rescue him from a situation of unexampled embarrassment, and put an end to a state of affairs, ill calculated, he fears, to sustain the interests of the united kingdom, in this awful and perilous crisis, and most difficult to be reconciled to the genuine principles of the British constitution."

Chief-Justice Downes. The Catholics, however, continued to hold their meetings, and some of the delegates were arrested. On the 8th of November, new bills were found against several of the delegates by the grand jury of Dublin; and, on the 21st of November, Dr Sheridan was tried before the Court of King's Bench. The trial lasted two days, and the jury brought in a verdict of not guilty. The issue of this trial being decisive with respect to the other delegates who had been arrested for the same offence, the attorney-general moved for leave to send up new bills of indictment to the grand jury on the ground of informality. Informations *ex officio* were also filed against Lord Fingal, and several other gentlemen, for attending the Catholic meetings, and for publishing an account of their proceedings.

The attention of parliament was called, during the present session, to the state of commercial credit, and a select committee was appointed to report upon this subject. The great embarrassments which prevailed in the commercial world appear to have first arisen out of extensive speculations, which commenced on the opening of the South American markets. The immense cargoes which were sent to the ports of South America, overstocked the markets, and the merchants were obliged to bring back their cargoes to England. On their return, they found the country glutted; and as no market remained for them on the continent of Europe, the exporters were unable to pay the manufacturers when their bills became due, and, of course, the manufacturers were involved in the same distress. This embarrassment seemed to prevail principally among the cotton manufacturers. In order to relieve this distress as much as possible, six millions of Exchequer bills were issued, on condition that the merchants who obtained aid should give security for repayment at a limited time.

In consequence of a message from the Prince Regent, the attention of both houses of parliament was called to the subject of a subsidy to Portugal. The sum of one million had been granted in the year 1810, for the purpose of taking Portuguese troops into British pay, and having them disciplined and commanded by British officers. The success with which this plan was attended, and the courage and perseverance which had been displayed by the Portuguese in the last campaign, were held out by ministers as a reason for increasing the subsidy to two millions. The opposition represented this system of policy as an enormous drain on the resources of the country; and they expressed their belief, that whatever temporary success might attend the allied arms, Portugal must ultimately fall under the overwhelming power of France. The grant, however, was carried without a division.

The year 1811 was distinguished by the fall of the last colony of France. About the middle of summer, an expedition sailed from India, for the purpose of reducing the settlement of Batavia. Lord Minto, the governor-general of India, attended it in person, while the army was commanded by Sir Samuel Auchmuty, and the naval part of the expedition by Rear-Admiral Stopford. The troops landed on the 4th of August at the village of Chillingching, about twelve miles to the east of the city of Batavia, and advanced to the capital by the road along the coast. The bridge over the Anjol having been broken down by the enemy, the army passed the river in boats on the 7th, and lodged themselves in the suburbs of the city. A temporary bridge, capable of sup-

porting light artillery, was constructed on the 8th; and, on the same day, the town of Batavia surrendered without opposition, and the garrison retreated to Weltevrede. Early on the morning of the 10th, Colonel Gillespie moved with his corps towards the enemy's cantonments at Weltevrede, supported by two brigades of infantry that followed his route. The cantonment was abandoned, but the enemy held a strong position about two miles in advance of their works at Cornelis, and defended by an abbatis, occupied by 3000 of their best troops and four guns of horse artillery. After an obstinate resistance, this position was carried at the point of the bayonet, the enemy were completely routed, and their guns taken. A strong column advanced to their support from Fort Cornelis; but the British line having arrived, it was instantly driven under the shelter of their batteries. In this affair, the enemy lost about 500 men, with Brigadier-General Alberti dangerously wounded. The enemy, who greatly outnumbered the British troops, were now strongly entrenched between the great River Jacatra and an artificial watercourse, called the Sloken, neither of which were fordable. A deep trench, strongly pallisadoed, enclosed this position; and the most commanding grounds within the lines were occupied with seven redoubts, and numerous batteries mounted with heavy cannon. The fort of Cornelis was in the centre, and all the works were defended by a numerous and well organized artillery. For the purpose of carrying the works by assault, several batteries were erected, and a heavy fire kept up for two days from twenty eighteen pounders, and eight mortars and howitzers, silenced their nearest batteries, and disturbed every part of their position.

On the 26th of August, at break of day, the British troops marched to the assault. Colonel Gillespie commanded the infantry of the advance, and the grenadiers of the line, and was supported by Colonel Gibbs, with the 59th regiment, and the 4th battalion of Bengal volunteers. The object of this column was to surprise the redoubt constructed by the enemy beyond the Sloken, to endeavour to cross the bridge over that stream with the fugitives, and then to assault the redoubts within the lines. Lieutenant Colonel McLeod, at the head of six companies of the 69th, was directed to follow a path on the banks of the Jacatra, and when the attack upon the Sloken had commenced, to take possession of the enemy's left redoubt. Major Yule, with the flank corps of the reserve, reinforced by two troops of cavalry, four guns of the horse artillery, two companies of the 69th, and the grenadiers of the reserve, was directed to attack the corps at Campong Maylayo, on the west of the Jacatra, and to cross the bridge at that post. The rest of the army under General Wetherall was placed at the batteries, from which a column under Colonel Wood, consisting of the 78th regiment, and the fifth volunteer battalion, was directed to advance in front against the enemy at the first favourable moment, to force his way, and open the position for the line.

After a long detour through a close and intricate country, Colonel Gillespie came up with the advanced guard of the enemy, put it to the rout, and took possession of the advanced redoubt, under a heavy fire of grape and musketry. He then passed the bridge with the fugitives, and, under a most tremendous fire, he assaulted and carried with the bayonet another redoubt. The two divisions of this column having now separated, Colonel Gibbs turned to the right, and with the 59th

in front, and part of the 78th, who had forced their way in front, he carried a third redoubt. No sooner was this redoubt taken, than a tremendous explosion of the magazine took place, and destroyed a number of our officers, and soldiers who were upon the ramparts which the enemy had abandoned. The left redoubt of the enemy was carried, in the most gallant manner, by Lieutenant Colonel McLeod, who fell in the very moment of victory. The front of the position being now opened, the troops rushed in from every quarter. While these operations were going on in the right, Colonel Gillespie carried the redoubts towards the rear, and being joined by Lieutenant Colonel McLeod of the 59th, with part of that corps, he directed him to attack the park of artillery,—a duty which that officer discharged with the utmost gallantry, after having routed a body of the enemy's cavalry that had formed for the purpose of defending it. A strong body of the enemy who had posted themselves in the lines, in front of Fort Cornelis, maintained a sharp fire of musketry; but they were soon driven from their position, and the fort was taken by the British. The enemy being now completely dispersed, were pursued by Colonel Gillespie with the 14th regiment, and a party of Sepoys, and by the seamen from the batteries, under the command of Captain Sayer of the Royal navy. The cavalry and horse artillery, however, now effected a passage through the lines, and continued the pursuit, till the whole of the enemy's army was either killed, taken, or dispersed. The column under Major Yule, succeeded in routing the troops at Campong Maylayo, but he found the bridge on fire, and was therefore unable to proceed farther. The loss sustained by the British in these brilliant exploits, was 91 killed, and 513 wounded. More than 1000 of the enemy were buried in the works, multitudes were cut down in the retreat, the rivers were choked with the dead, and the huts and woods were filled with the wounded. Nearly 5000 prisoners were taken, among whom were three general officers, 34 field officers, 70 captains, and 150 subaltern officers.

General Jansens escaped with great difficulty during the action with the remnant of an army of 10,000. After reaching Bugtenzorg, he retreated, by an eastern route, with the intention of collecting his remaining force, near Samarang, and retiring upon Solo. The British troops arrived at Samarang on the 9th September; but in consequence of an attack by the boats of the British squadron, General Jansens had evacuated Samarang, and retired to a strong position about six miles off, where he erected batteries and entrenchments. This new position was forced with great gallantry, by Colonel Gillespie, who pursued the enemy to Oonorang, from which they were also compelled to retire in the utmost confusion. An armistice was now requested by General Jansens, and, on the 17th, a capitulation was signed, by which the French officers and privates were made prisoners of war.

The present year was not distinguished by any naval operations of peculiar interest or importance. With no enemy to encounter but the elements, the British navy could not be expected to gather many laurels. The defence of Anholt by a handful of British sailors and soldiers, is perhaps one of the most brilliant exploits that we have had occasion to record. On the 27th of March, this island was attacked by a Danish flotilla, consisting of 18 heavy gun-boats, carrying nearly 4000 men. Having landed in three divisions, they made three succes-

sive attempts to storm the fort and batteries; but they were uniformly repulsed by the bravery of the garrison. A signal was now made to the Danish gun-boats, which opened a heavy fire on our works; but a well directed discharge of grape and musketry from the two batteries, killed their leader, who was a captain in the Danish navy, and made great havoc among the troops. Discouraged by the loss of their commander, the Danes retired for shelter behind some sand hills; but Lieutenant Baker anchored the Anholt schooner on their flank, and forced them, by a most destructive fire, to surrender at discretion. The loss of the Danes amounted to 50 men killed, besides a number of wounded, and no fewer than 504 prisoners fell into our hands, along with three pieces of artillery, 500 muskets, and 3000 rounds of cartridges. The third division of the expedition embarked under cover of the gun-boats; but they were attacked on their way to the Danish coast by his majesty's ships the Sheldrake and Tartar, who captured several of their gun-boats, and took 150 prisoners.

An exploit scarcely inferior in gallantry, but more remarkable for having been performed in the presence of Bonaparte, was achieved off Boulogne by the Naiad frigate, three sloops of war, and a cutter, over seven large praams, eleven gun-brigs, and other small craft, amounting to 27 sail. On the 22d of September, at noon, the British ships began the attack, and soon compelled the French admiral to retire. Bonaparte, who was viewing the action along with Marshal Ney, in a barge on the outside of the harbour, directed a French commodore to proceed with his praam, mounting 12 long brass 28 pounders, to assist the admiral. The French vessel ran along side with the intention of boarding; but Captain Carteret dreading that she would run off, lashed her to his own ship, and, in a short time, compelled her to strike. The French admiral, with the rest of his fleet, now made towards the harbour of Boulogne; and Bonaparte is said to have been so enraged at their retreat, that he ordered the guns of the batteries to be turned on the flotilla, to drive them out to renew the engagement.

The British navy sustained a considerable loss towards the end of the year, from the tempests which raged in the north seas. On the morning of the 24th December, the St George of 98 guns, commanded by admiral Reynolds, and the Defence of 74 guns, commanded by captain D. Aitken, were driven on shore on the coast of Jutland, and the whole of the crews, amounting to nearly 1400 men, perished in the wrecks. At break of day on the 25th of December, the Hero of 74 guns, was stranded on a sand bank off the Texel, and the whole of her crew likewise perished.

The differences which had so long subsisted between this country and America, rose to a still greater height in the course of the present year. We have already seen, that the non-intercourse act was to be put in execution against Great Britain, on the 2d of February 1811, unless the orders in council were rescinded, and the commerce of neutral nations restored to its former footing. A vessel from New York, however, having been seized by the French under the Berlin and Milan decrees, Mr Randolph, a member of congress, moved for a bill to repeal the non-intercourse act. This motion being rejected, it was agreed to recommit the non-intercourse act to the committee of foreign relations, till full proof was obtained of the complete revocation of the French decrees. Desirous, if possible, to bring the

various points in dispute to a speedy adjustment, the Prince Regent appointed Augustus John Foster, Esq. to be minister plenipotentiary to the United States; but before his arrival in America, a new and unexpected ground of difference arose between the two nations. On the 16th of May, the United States frigate the *President*, of 44 guns, commanded by Commodore Rodgers, gave chase to his majesty's vessel the *Little Belt*, of 18 guns, commanded by Captain Bingham. When the American frigate came within hail, Captain Bingham asked what ship it was? Commodore Rodgers repeated the words of the British captain, and immediately fired a broadside, which was instantly returned from the *Little Belt*. The action then became general, and continued for three quarters of an hour, when the firing of the American vessel ceased. About the same time the *Little Belt* was obliged to desist from firing, on account of the damage which she had sustained in her masts, sails, rigging, and hull. Commodore Rodgers again hailed, and asked what ship it was? and being answered by Captain Bingham, he then asked if the *Little Belt* had struck her colours? After giving a negative answer to this question, Captain Bingham asked the name of the other vessel, and was answered that it was the United States frigate, the *President*. Commodore Rodgers then parted from the *Little Belt*; but on the morning of the 17th he bore up, and sent a message to Capt. Bingham, regretting the occurrence of such an unfortunate affair, and stating that he would not have fired had he known the inferiority of the British force. Captain Bingham asked him the motive which induced him to fire at all? to which the commodore replied, that the first gun was fired at him. In the account of this affair, communicated to the American government by commodore Rodgers, he positively maintains, that the first gun was fired from the British vessel; and in the inquiries which were subsequently instituted by both governments, the evidence of the one crew was decidedly at variance with the evidence of the other. We are not willing that national partiality should bias our judgment in this singular affair, but we can scarcely believe, that a vessel of 18 guns would rashly provoke the hostility of a frigate of 44 guns; and if captain Bingham had been so regardless of his duty, as to insult the American flag by the first fire, it is not within the limits of credibility that commodore Rodgers would bear up next morning, regret the unfortunate affair which had happened, and offer every assistance to his disabled enemy.

After the arrival of Mr Foster in America, his correspondence with Mr Monroe, the Secretary of State, related chiefly to the British orders in council; the one party asserting, that the Berlin and Milan decrees were effectually repealed, while the other maintains that their repeal was merely partial and fallacious. The American minister contends, that we are bound to respect the solemn declaration of the French government on the 5th of August 1810, that the decrees were repealed;

and he alleges, that the liberation of four or five American vessels, which had been captured and brought into French ports since the 1st of November, is a convincing proof of the sincerity of France. Mr Foster, on the other hand, maintains, "that the seizure of American vessels by the French since the 1st of November, and the positive and unqualified declarations of the French government, are stronger proofs of the continued existence of the Berlin and Milan decrees, than the restoration of five or six vessels, too palpably given up for fallacious purposes, or in testimony of satisfaction at the attitude taken by America, is a proof of their revocation, or of a return to the principles of justice."*

In adjusting the affair of the *Chesapeake* and *Leopard*, which had so long been a subject of difference between the two countries, the British ambassador was more successful. He was authorised by the Prince Regent to offer the immediate restoration of the men who, in consequence of admiral Berkeley's orders, were forcibly taken out of the *Chesapeake*, to the vessel from which they were taken; or, if that ship should be no longer in commission, to such sea-port of the United States as the American government might name for that purpose. Mr Foster was also instructed to offer to the American government a suitable pecuniary provision for the sufferers, in consequence of the attack upon the *Chesapeake*, including the families of those seamen who unfortunately fell in the action, and of the wounded mariners. These offers of reparation were accepted as satisfactory by the American government; and the symptoms of a conciliatory disposition, which were on this occasion evinced by both governments, encouraged a hope that every other ground of difference would speedily be removed. These hopes, however, subsequent events have shewn to be fallacious. The report of the committee of foreign relations, on the President's message, plainly intimates, that war alone can decide the differences which subsist between the two countries; and naval and military preparations are recommended as the prelude to a declaration of war. The threatening attitude which America has now assumed, appears somewhat inconsistent with that hesitating policy which she has maintained since the 2d of February, respecting the enforcement of the non-intercourse act; and a short time will shew, whether her warlike preparations are the spontaneous efforts of an independent people, determined to redress their wrongs,—or the ostentatious menaces of a faction, blinded by foreign influence, and expecting to obtain a compliance with their views, from the hazardous chances of war.

On the 7th of January, parliament was opened by a speech from the Prince Regent, which was delivered by commission. The Regent expressed his deep sorrow at the continuance of his majesty's indisposition, and at the unhappy disappointment of those hopes of his majesty's early recovery, which had been cherished by his family and his people. Parliament was congratulated on

* The nature of Mr Foster's argument will be better understood from the following paragraphs of the President's message to Congress, on the 5th November 1811:—"The justice and fairness which have been evinced on the part of the United States towards France, both before and since the revocation of her decrees, authorised an expectation that her government would have followed up that measure, by all such others as were due to our reasonable claims, as well as dictated by its amicable professions. No proof, however, is yet given, of an intention to repair the other wrongs done to the United States, and particularly to restore the great amount of American property, seized and condemned under edicts which, though not affecting our neutral relations, and therefore not entering into the question between the United States and the other belligerents, were nevertheless founded on such unjust principles, that the reparation ought to have been prompt and ample.

"In addition to this, and other demands of strict right on that nation, the United States have much reason to be dissatisfied with the rigorous and unexpected restrictions, to which their trade with the French dominions has been subjected, and which, if not discontinued, will require at least corresponding restrictions in importations from France into the United States."

the complete success of the measures which had been pursued for the defence and security of the kingdom of Portugal. The surprise of general Girard's division by general Hill, was noticed as a brilliant and important enterprise; and the consummate judgment and skill displayed by lord Wellington in the direction of the campaign, received its full praise. The perseverance and gallantry of the Spaniards, and the fitness of the new system of warfare to the actual condition of the Spanish nation, are adduced as reasons for continuing to afford the most effectual aid to the Spanish people. The capture of the islands of Bourbon and the Mauritius, and of the settlement of Batavia, are noticed as giving great additional security to the British commerce and possessions in the East Indies. The speech recommends to the attention of parliament the propriety of providing such measures for the future government of the British possessions in India, as shall secure their internal prosperity, and enable us to derive from these flourishing dominions the utmost degree of advantage to the commerce and revenue of the united kingdom. The speech regrets, that though the affair of the Chesapeake had been finally settled, various important subjects of difference with the government of the United States still remained unadjusted, and states, that the Prince Regent will continue to employ such means of conciliation as may be consistent with the honour and dignity of his majesty's crown, and with the due maintenance of the maritime and commercial rights of the British empire.

The only subject of national importance which has been brought under the consideration of parliament, was the state of Ireland. On the 31st of January 1812, Lord Fitzwilliam, in the House of Peers, moved for a committee of the whole house to take into consideration the state of Ireland. After a long debate, in which the usual arguments for Catholic emancipation were eloquently urged, the motion was rejected by a majority of 83, the numbers being 162 and 79. The same motion was made in the House of Commons by Lord Morpeth. The debate continued two days, and the motion was lost by a majority of 94, the numbers being 229 and 125.

The Spanish campaign of 1812 was opened by an event highly disastrous to the cause of the allies. The army under general Blake, which was posted in the entrenched camps of Manessa and Quarte, in the neighbourhood of Valencia, was attacked on the morning of the 26th December, by the French army under Marshal Suchet. After a severe battle, in which the Spaniards displayed the greatest gallantry, the French succeeded in forcing the entrenched camps of Quarte and Manessa, and the cannon, baggage, and caissons of the Spaniards fell into their hands. General Count Reille arriving at this moment on the Aldenga, turned the enemy, and made a great number of prisoners. General Blake being thus cut off from the road of Murcia, threw himself with his troops into Valencia, which was immediately invested by the French. On the night of the 22d of January, the French opened trenches within 70 or 80 toises of the Spanish works, and in the space of four days their mines were carried within 50 toises of the fosse. In consequence of these preparations, the Spaniards abandoned their fortified lines, defended by 80 pieces of cannon. On the 5th of January, the bombardment of the town commenced; and, on the 6th, Suchet offered a capitulation, which was refused. In the space of three days, 2700 bombs were thrown into the city, which was on fire in several places. Two batteries of

10 24-pounders each, were erected for the purpose of making a trench in the interior defences, and the engineers had effected a lodgment in the out-houses of the suburbs, and placed mines under the two principal gates. In order to avoid the dreadful consequences of an assault, general Blake accepted a capitulation, by which the Spanish troops were permitted to march out with the honours of war, and lay down their arms beyond the bridge on the left bank of the Guadalaviar. By the surrender of Valencia, 16,131 troops of the line, 374 pieces of artillery, 180,000 pounds of powder, 3,000,000 of cartridges, 1800 cavalry and artillery horses, 21 stand of colours, and 893 officers, fell into the hands of the French. Marshal Suchet has, in consequence of this important capture, been honoured with the title of Duke of Albufera.

The operations of the French army in Andalusia, were not attended with the same success. The army under General Laval laid siege to Tariffa on the 20th of December 1811. On the 29th they began to batter in breach, and till the 31st they kept up a heavy fire of cannon on the breach, and of shells on the town causeway and island. On the morning of the 31st, a strong column of French troops, amounting to 2000, composed of all the grenadiers and voltigeurs of the army, advanced rapidly to the breach; but the British and Spanish troops, under Colonel Skerret, attacked them with such intrepidity, that in less than an hour they were completely repulsed. Numbers of the enemy fell near the foot of the breach, and the rest of the column made a precipitate retreat. The situation of the enemy's wounded, with which the ground was covered between his battery and our fire, where they must inevitably have perished, induced Colonel Skerret to hoist a flag of truce to carry them off. Some of them were brought into the place over the breach; but, from the extreme difficulty of this operation, the enemy were permitted to carry the rest away. The garrison of Tariffa consisted only of 1000 British troops, and about 800 Spaniards. The walls of the town had been built merely as a defence against archery, and had the additional disadvantage of being commanded within half musket-shot, and flanked, or taken in reverse in almost every part. The French continued to keep up a partial fire upon Tariffa; and on the 1st of January, the breach was completely open for the space of 25 or 30 yards. The enemy durst not venture, however, upon a second assault; but taking advantage of a dark and stormy night, they made a precipitate retreat, and left behind them all their artillery, ammunition, and stores.

Lord Wellington having removed his head-quarters from Frenada to Gallegos, invested Ciudad Rodrigo on the 8th of January. By means of a pallisadoed redoubt on the hill of St Francis, and by fortifying three convents in the suburb, the defences of which are connected with the redoubt, the enemy had so much increased the difficulty of approaching the place, that Lord Wellington was obliged to obtain possession of the work on the hill of St Francisco, before any progress could be made in the attack. A detachment of the light division under Colonel Colborne was accordingly directed to attack the work soon after it was dark, and in a short time it was taken by storm, with the loss only of a few men. By obtaining possession of this work, he was enabled to break ground within 600 yards of the place, though the fortified convents were still in the possession of the French, and the redoubt on St Francisco was turned

into a part of the first parallel. On the 14th of January, the fire of 22 pieces of ordnance was opened from the three batteries in the first parallel, and on the evening of the same day, the besiegers were established in the second parallel, the enemy's detachment having been previously dislodged from the convent of Santa Cruz, by Lieut. General Graham. The convent of San Francisco, and the other fortified posts in the suburb, were likewise taken on the same evening; and by these operations the approaches were protected both on the right and left. From the 15th to the 19th, Lord Wellington continued to complete the second parallel and the communication with the work, and had made some progress by sap towards the crest of the glacis; and on the night of the 15th, he had likewise advanced from the left of the first parallel down the slope of the hill towards the convent of St Francisco, to a situation from which the walls of the Fausse Braye and of the town were seen. A battery of seven guns was here constructed, and on the morning of the 18th its fire commenced. On the evening of the 19th, the batteries of the first parallel had not only considerably injured the defences of the place, but had made breaches in the Fausse Braye wall, and in the body of the place, which were considered practicable; while the battery on the slope of the hill had been equally efficient still further to the left, and opposite to the suburb of St Francisco. Though the approaches were not brought to the crest of the glacis, and though the counterscarp of the ditch was still entire, Lord Wellington determined to storm the place. Five columns accordingly marched to the attack, on the evening of the 19th. The two right columns, led by Colonel O'Toole and Major Ridge, were destined to protect the advance of Major-General Mackinnon's brigade, forming the third column, to the top of the breach in the Fausse Braye wall; and all these, being composed of troops of the third division, were under the command of Lieutenant-General Picton. The fourth column, which belonged to the light division, under Major-General Craufurd, attacked the breaches on the left, in front of the suburb of St Francisco, and covered the left of the attack

upon the principal breach; while Brigadier-General Pack's brigade, forming the fifth column, was directed to make a false attack upon the southern face of the fort. In addition to these columns, the 94th regiment descended into the ditch in two columns, on the right of Major-General Mackinnon's brigade, in order to protect the descent of the body into the ditch, and its attack of the breach in the Fausse Braye, against any obstacles which the enemy might construct to oppose its progress.

All these attacks were attended with success. The false attack of Brigadier-General Pack was even converted into a real one, and his advanced guard followed the enemy's troops from the advanced works into the Fausse Braye, where they made prisoners of all who were opposed to them.

After escalading the Fausse Braye wall, Major Ridge stormed the principal breach in the body of the place, along with the 94th regiment under Lieutenant Colonel Campbell, which had moved along the ditch at the same time. In this manner did these regiments not only cover the advance from the trenches of Major-General Mackinnon's brigade, but they even preceded it in the attack. The troops of the light division on the left, under Major-General Craufurd, and Major-General Vandeleur, were likewise far advanced; and in less than half an hour from the commencement of the attack, the British troops were formed on the ramparts of the place, and the enemy were compelled to submit, after sustaining a severe loss. The loss of the British, particularly in officers, was very great. Major-General Mackinnon was unfortunately blown up, by the accidental explosion of one of the enemy's expence magazines, close to the breach, after he had gallantly conducted to the attack the troops under his command. Major-Generals Craufurd and Vandeleur were both severely wounded. Great quantities of ammunition and stores, and 153 pieces of ordnance, including the heavy train of the French army, were found in Ciudad Rodrigo. The governor, along with 78 officers and 1700 men, likewise fell into our hands.* (*)

* In the preceding article we have confined ourselves strictly to the history of BRITAIN since the union of the crowns of England and Scotland, in the year 1603. The separate histories of ENGLAND, SCOTLAND, and IRELAND, and the statistics, manufactures, and commerce, &c. of these kingdoms, will be introduced with more propriety under their respective names.

INDEX.

Zealand, invasion of, by the British, 663

NOTE.—The history of Britain, in the article before us, as it comes from the pen of the European editors, descending no lower than to the early part of the year 1812, it becomes the duty of the editors in the United States to continue it, in some shape, to the present period. Here, however, obstacles present themselves, which, under the broken and limited intercourse now existing between Europe and America, it is a task of no small difficulty to surmount. Unfortunately, at the very point of time where the article as originally written terminates, the war between Great Britain and the United States commences. This unhappy event, so ruinous to the prosperity of both nations, and so inimical to the interests of the civilized world, has, in a moment of political delirium, hermetically sealed all direct and customary avenues to general and friendly communication between the two countries.

Possessed as we are of too limited evidence touching most of the great occurrences abroad to justify us in recording them as events in history, we shall, in our additions to the present article, be compelled to confine ourselves almost exclusively to those transactions in which the United States is a party concerned. This circumstance, however, although certainly to be regretted, we notwithstanding lament the less, in consideration of the higher and more lively interest we are confident a great majority of our readers will feel, in those occurrences that relate immediately to their own country, and in which, to no inconsiderable extent, their own character, as Americans, is implicated.

Before attempting to continue the history of Britain from the period at which it terminates in the present article, we beg leave to call the attention of the public, in a very particular manner, to two events of anterior date. Of these, one has been (for what reason it does not belong to us to hazard a conjecture) entirely overlooked by the European editors, while, in their pretended representation of the other, truth has sustained a flagrant violation. The first of these is the wanton and unprincipled attack on the United States frigate the *Chesapeake*, of thirty-six guns, by the British ship of war the *Leopard*, of fifty guns; and the other, the unfortunate affair between the American frigate the *President*, and H. B. M. sloop of war the *Little Belt*.

In relation to the outrage committed on the frigate *Chesapeake*, the following is a brief outline of the particulars.

On the 22d of June 1807, that vessel, bound on a cruise to the Mediterranean, sailed from Hampton Roads, having on board four seamen who had lately deserted from H. B. M. ship of war, the *Melampus*. The restoration of these men to H. M. service had been previously demanded by the British consul, then resident in Norfolk. As it was believed, however, at the time, and afterwards *satisfactorily proved in relation to three of them*, that they were not British subjects, but native Americans, who had been pressed into the service of the British navy, a compliance with the demand of the consul was refused.

When the *Chesapeake* sailed from Hampton Roads, a British squadron lay at anchor near the Capes of Virginia, within the waters of the United States, and consequently in the actual enjoyment of American hospitality. As the American frigate approached this squadron, one of them, the *Leopard*, a double decker, weighed anchor and stood to sea before her. When

about three leagues from land, this vessel approaching within speaking distance of the *Chesapeake*, her commander, Captain Humphreys hailed, requesting permission to send on board a dispatch from Admiral Berkley, who held at that time the chief command of the British fleet on the American station. Captain Baron of the *Chesapeake*, supposing that the dispatch alluded to was for Europe, politely brought his vessel to, for the purpose of receiving it. An officer from the *Leopard* now coming on board, presented a letter covering a demand from Admiral Berkley for the four deserters from the *Melampus*, with an order to take them by force in case their immediate restoration should be refused. Captain Baron, by the return of the officer, replied by letter, that the demand was of such a nature that both his honour and his duty forbade a compliance. On the reception of this answer, the *Leopard*, ranging up along side of the *Chesapeake*, at the distance of about half pistol shot, opened from her batteries a most tremendous fire, while the American frigate, thus taken by surprise by a vessel vastly superior in force and belonging to a nation at peace with the United States, was wholly unprepared to make any resistance. The British vessel continued the attack till three of the *Chesapeake's* crew were killed and eighteen wounded, several of them mortally, when the latter ship struck her colours. Captain Humphreys then proceeded to take by force the seamen he had before demanded; but, refusing to consider the American frigate as his prize, she returned to port in a shattered condition.

An outrage so flagrant in itself, so unprovoked, so unprecedented in the annals of civilized nations, and perpetrated under the eye of the American people, gave rise to a burst of resentment, as wide as the limits of the United States, and as warm and indignant as the bosoms of high spirited freemen could cherish. For a time entire unanimity prevailed. Party distinctions and animosities were forgotten, and, at that moment, a declaration of war against Great Britain, when she was so palpably the guilty aggressor, would have accorded with the feelings of a vast majority of the American people. But when the British government afterwards disavowed the act, and, by time and reflection, reason had regained her ascendancy over feeling, the passion for war became less predominant. Still, however, in the breasts of thousands it continued to prevail with but little abatement; and there exists not a doubt, that the affair of the *Chesapeake*, although finally adjusted by the two governments, had a powerful influence in preparing the minds of many, even of the influential citizens of the United States, for the scenes of hostility and slaughter which have subsequently ensued. On the spirits of our naval officers, in particular, it has never ceased to hang with a most embittered and galling effect, urging them on, under an irresistible impulse of disappointed ambition and wounded pride, to wash off in blood the stain which they conceived it had affixed on their own honour, and our national character. It is therefore our deliberate opinion, that Admiral Berkley stands justly chargeable with no inconsiderable portion of the guilt which attaches to the authors of the present war. Yet instead of experiencing, for so wickedly trampling on the peace of the two nations and the welfare of millions, any decided mark of the displeasure of his government, he was simply recalled from the American station, suffered to indulge himself a few months on shore, and afterwards appointed

to a more honourable command. In the calm and discriminating eye of posterity, when the conflicting passions and party prejudices which now exist shall have subsided, and the local jealousies of these times shall have been buried in oblivion, this will amount, not to punishment, but to "hire and reward"—encouragement in guilt, rather than just and salutary correction.

It is but justice, moreover, on the present occasion, to record and hand down to posterity another act of the deepest atrocity, which was committed within the waters of the United States, and is calculated to impress on the character of the British navy a stain which time will never wash away. It is the wanton and unprovoked murder of John Pierce, a native of the United States, while peaceably navigating, in the line of his vocation, a small coasting vessel near Sandy Hook. This sanguinary deed was perpetrated on the 25th of April 1806, by a shot fired at Pierce's vessel from the British ship of war *Leander*, commanded by Captain Henry Whitby. On a representation of the enormity, accompanied by a spirited remonstrance to the British government, Captain Whitby underwent, indeed, *the mockery of a trial*, the result of which was disgraceful to every one concerned in the transaction. Although the fact charged against him was susceptible of abundant and satisfactory proof, the culprit was not only acquitted, but promoted soon afterwards to a higher command. This glaring outrage, committed against the peace and sovereignty of the United States, and the safety of her unoffending citizens, had also its effect in widening the breach and fostering a spirit of hostility between the two countries; on which ground alone the author of it was worthy of exemplary punishment. When officers entrusted with arms and power are not only tolerated, but actually encouraged in insult and wrong, the only alternative left to the suffering party is the resistance of freemen or the submission of slaves.

We cannot for a moment admit that the editors of the *Edinburgh Encyclopædia* are capable, in any case, of intentional misrepresentation. From their elevated standing as scholars and philosophers, and their unblemished character as men of morality and honour, we feel a conviction that the fact is otherwise. Yet it must not be concealed, as heretofore intimated, that their statement in relation to the affair of the *Little Belt* is at variance with truth; nor is their reasoning upon the subject free from fallacy.

When the two vessels concerned had approached within speaking distance, Captain Bingham of the *Little Belt* did not, as the editors positively assert, *hail first*; nor is it a fact, that the *first shot* was fired from the United States frigate the *President*. The very reverse of this representation is known to be true. Commodore Rogers *hailed first*, "What ship is that?" and was answered only by a repetition of his own words. He hailed a second time in the same terms, and, before he had taken the trumpet from his lips, received a shot from the *Little Belt*, which cut away some of his rigging and injured his mainmast. Although, therefore, the American frigate did give chase, a step in which she had ample grounds of justification, the British vessel became evidently the aggressor by firing the first gun. This fact was unequivocally established in a court of inquiry instituted in relation to the affair by the American government.

The European editors are equally incorrect in the

statement they give touching the length and issue of the conflict. Instead of sustaining the action for *three quarters of an hour*, the fire of the *Little Belt* was completely silenced in *five minutes*. It is true, that, in abuse of the generous clemency of her conqueror, she afterwards renewed the attack, with some slight injury to the American frigate, but was silenced and reduced almost to a wreck in the same short period of time. In neither instance did the fire of the American frigate cease till she had silenced that of her feeble antagonist; in which case, she, from motives of humanity, discontinued the contest.

It is not true, as stated by the editors, that Commodore Rodgers *parted from the Little Belt* when the conflict was over. The humanity of the American commander was here again conspicuous. Conscious that his adversary was reduced to a shattered and dangerous condition, he was anxious for his safety, and desirous of rendering him whatever assistance his situation might require. He accordingly, instead of parting from a vanquished enemy and leaving him to his fate, lay to on different tacks during the whole of the night (it being dark when the battle was fought) displaying at the same time a number of lights, in order that the British vessel might be the better able to discover his position, and claim his good offices in case they should be wanted.

On the following morning, as soon as commodore Rodgers could discover the position of his disabled enemy, he bore up to him, offered him every requisite assistance in repairing the damages he had sustained, and expressed his regret at the necessity, on his part, which had led to a result so peculiarly unfortunate.—This, even Britons themselves will acknowledge, was the act of a generous and magnanimous foe. The conflict was now over, the victory was complete, all irascible and vindictive passions had subsided, and sympathy for the misfortunes of the guilty aggressors occupied alone the breast of the conqueror.—He was now as anxious to minister to their distresses, as he had been before to avenge the insult they had offered to his flag.—Yet, strange and incredible as it must appear, it is notwithstanding true, that on this very ground the European editors have taken exception at the conduct of the American commander, and expressed sentiments unfriendly to his character.—"Had he not," say they, "in the conflict with the *Little Belt*, been himself the first aggressor, it is not within the limits of credibility that he would bear up next morning, regret the unfortunate affair which had happened, and offer every assistance to his disabled enemy."

It is neither our wish nor our intention to speak offensively.—We hold ourselves, however, bound to defend, as far as they appear to us capable and worthy of defence, the conduct and character of the American commander. In relation to the sentiments which we have just quoted, we are forced to confess our utter inability to reconcile them either with the dictates of an enlightened mind, or the feelings and emotions of a generous heart.—Without the least reference to the party commencing the attack, commodore Rodgers discovered, and had ground for discovering, three distinct sources of regret in the unfortunate affair of the *Little Belt*.—He regretted having been compelled, in vindication of the insulted honour of his flag, to chastise an enemy of inferior force: he regretted the blood which had been

unnecessarily shed in the course of the contest: and he regretted most sincerely the angry passions which such an event could not fail to excite, as they would inevitably contribute their part to involve his country in a ruinous war.

As to the polite and christian-like tender of assistance which commodore Rodgers made to captain Bingham, we hope that, under similar circumstances, no American will ever act otherwise. "If thine enemy hunger, give him bread; if he thirst, give him drink." Wherefore, then, in case he be at sea, and his vessel in a shattered and sinking condition, are we not at liberty, without incurring censure, to interpose and endeavour to rescue him from a watery grave? That warrior is but half a hero and unworthy of victory, who can look with a cold indifference on the miseries occasioned by his own arm, in the course of the conflict, by which he achieved it.

The truth is, that, in the estimation of every unprejudiced enquirer, captain Bingham stands clearly chargeable with the commencement of the attack.—On his particular motives for such temerity we will not attempt to offer a conjecture. We confidently believe, however, that had the issue proved honourable to him, instead of denying the fact, he would have candidly avowed it, and justified his conduct in the following manner: The American frigate gave me chase, and bore down on me in a threatening attitude. Believing her intentions to be hostile, I did not consider myself bound to await her fire.—I accordingly chose my own time for commencing the action, and trust that my government and the world will find ground to acquit me of precipitation and wrong.

But as the result of the battle proved so signally disastrous to captain Bingham, leaving him not a sentiment of self complacency to mitigate the deep mortification which he experienced, he found it necessary to gloss over his conduct by some apology, to hold forth some specious shew of justification for rashly engaging in a conflict where nothing but defeat and destruction could await him.—Hence, with an equal want of magnanimity and truth, he threw the blame of the first aggression on the American frigate.

In reference to the length and issue of the action, as recorded by the pen of the European editors, we will simply observe, that if the Peacock, a vessel of equal size and force with the Little Belt, was sunk by the Hornet of eighteen guns, in *fifteen minutes*, and the Frolick reduced to a wreck by the Wasp in *forty-three*, whence is it credible, we might almost have said possible, that captain Bingham could sustain an action of *forty-five minutes* with the *President*, the most powerful frigate in the American navy, and still be able to keep himself afloat? The truth is, that had the President, with all her force, directed her fire at him but half the time, she would either have sent him to the bottom, or strewn his vessel in fragments over the water.

The prospect of an amicable adjustment of existing differences between Great Britain and the United States continuing to become daily more dark and unpromising, Congress met, pursuant to adjournment, on the 25th day of May, 1812. Notwithstanding the want of energy and system which had heretofore marked the proceedings of that body, something decisive was now expected. The crisis was such as must eventuate shortly in friendly accommodation, or open war.—Accordingly, in a mes-

sage from the President of the United States, bearing date the first of June, too intemperate, as we conceive, to comport with the dignity of the first magistrate of a powerful and enlightened nation, the necessity of the latter was strongly pressed on the attention of Congress. This was soon afterwards followed by a still more resentful manifesto to the house, from their committee of foreign relations—an instrument, in the composition of which reason and policy had been but little consulted, and all the angry and vindictive passions had lent them aid. To finish the climax of political madness, unprepared as the government was in soldiers, in money, and in ships, and opposed as the most wealthy and enlightened portion of the community was to the destructive measure, war against Great Britain and her dependencies was, by an act of Congress, formally declared on the 18th of June, and the same was announced in a proclamation from the executive on the following day. Active hostilities, both by sea and land, immediately ensued.

Early in July, brigadier-general Hull, at the head of a detachment of about two thousand troops, invaded the province of Upper Canada. On the 12th of the same month, from his head-quarters at Sandwich, he vain-gloriously issued the proclamation of a conqueror; in which, in a style of unseemly gasconade, he proffered his friendship and protection to such of the inhabitants as should remain neutral, but denounced against them vengeance and sure destruction, in case of their taking up arms with a view to oppose his triumphant career. It was not long, however, till the aspect and state of things in that quarter underwent a very signal, yet to many, not an unexpected reverse. General Hull not only found it expedient to retrograde precipitately within the American lines, but was compelled to surrender, with his whole army, to the force he had so lately menaced with annihilation; ceding to the enemy, at the same time, the Michigan Territory, over which he was governor. This event produced throughout the country a strong sensation, accompanied by a great diversity of sentiment. Some ascribed it to the cowardice of the commanding general, and some to treason; while others again discerned in it nothing but the incompetency of militia for military operations, or the still greater and more alarming incompetency of an administration, which had neglected to supply their troops with the necessary means; either for conquest or defence.

But a short time, however, had elapsed, before this blot sustained by the American arms on land was effaced by the achievements of our infant navy. On the 23d of June, the British frigate *Belvidere*, after a chase of several hours, in which she received considerable damage, escaped from the American frigate the *President*, by the excellence of her sailing, and the occurrence of a calm. The more certainly to effect her escape, the *Belvidere* sprung her water casks, and threw overboard her boats, and a number of her guns.

The 19th of August proved the commencement of a new era in the annals of naval warfare. On that memorable day, which the friends to American glory should hereafter celebrate as a national jubilee, the United States frigate the *Constitution*, captain Hull, rating forty-four guns, but carrying fifty-two, fell in with the British frigate *Le Guerriere*, captain Dacres, rating thirty-eight guns, but carrying forty-nine, both vessels being in the most perfect condition for battle. A desperate

action of thirty minutes ensued, in which the latter ship was carried with triumphant facility. So tremendous and well directed was the fire from the Constitution, that in that short space of time she reduced *Le Guerriere* to a perfect wreck—so much so indeed, that, being totally unfit to be towed into port, she was immediately burnt—she herself having received but very little damage. The slaughter on board the British frigate was great, that on board the American comparatively trifling.—Thus gloriously for the American arms commenced the naval war.

On the 18th of October, another distinguished victory was gained by the American sloop of war, the *Wasp*, captain Jones, mounting eighteen guns, over the British sloop of war the *Frolick*, captain Whinyates, mounting twenty-two guns.—The action lasted forty-three minutes, in which time the British vessel was literally cut to pieces, having almost all her officers, and more than two-thirds of her crew, either killed or wounded. The American vessel suffered severely in her spars and rigging, but sustained no material damage in her hull. Her loss in men was five killed and five wounded, none of them mortally. About two hours after the action, before the *Wasp* had time to repair the damages she had received, a British line of battle ship, the *Poictiers*, of seventy-four guns, came up and took possession of both her and her prize. Although captain Jones and his officers were, thus, by the fortune of war, deprived of their pecuniary reward, their glory, to noble minds, a still more elevated and precious recompence, will remain to them as long as gallantry and naval skill shall be held in estimation.

On the 25th of October, the American frigate, the United States, commodore Decatur, carrying fifty-two guns, fell in with the British frigate the *Macedonian*, captain Carden, mounting forty-nine guns, the latter vessel having the weather gauge. This circumstance enabled her to fight at her own distance in the sanguinary action which immediately ensued. Commodore Decatur not being able to bring his antagonist to close quarters, so as to employ with advantage his musketry and grape, the action continued an hour and a half before captain Carden struck his colours. So tremendous was the effect of the American fire, even at a distance, that had it been continued but a few minutes longer, the British vessel must inevitably have gone down. The American frigate was so slightly damaged, as to be ready for action again in half an hour. Had it not been for her anxiety to accompany her prize into port, for the purpose of preventing recapture or other accidents, her cruise would not have been shortened by the battle. The disparity in the loss of men on board the two vessels was also astonishingly great. The *Macedonian* had thirty-six killed and sixty-eight wounded, and the United States five killed and seven wounded.

On the 29th of December, the American frigate, the Constitution, now commanded by commodore Bainbridge, fell in with the British frigate, the *Java*, captain Lambert, mounting forty-nine guns, and having on board a crew of upwards of four hundred men. In the desperate and destructive action of one hour and fifty five minutes which here ensued, the superiority of American gunnery and naval skill was again displayed in the most triumphant manner. The *Java* was reduced to an entire wreck; her loss in men, sixty killed and one hundred and seventy wounded, many of them mortally.

The Constitution had nine killed and twenty-five wounded, the vessel herself but slightly injured. The British frigate being too much shattered to be towed into port, commodore Bainbridge ordered her to be burnt.

On the 24th of February 1813, another action, if possible, still more decisive in relation to the question of naval superiority, was fought between the American sloop of war the *Hornet*, captain Lawrence, of eighteen guns, and the British sloop of war, the *Peacock*, of twenty guns, commanded by captain Peake. The conflict, though short, and between two vessels of inferior force, is perhaps without a parallel in naval history. So destructive was the fire from the American sloop, that in less than fifteen minutes her antagonist, reduced to a sinking condition, struck her colours, displaying at the same time a signal of distress. Notwithstanding every possible exertion to save her, she sunk before the prisoners could be all removed, carrying down thirteen of her own crew and three of the brave crew of the *Hornet*. Owing to her sinking so soon after the action, the slaughter on board of the *Peacock* was never ascertained. It must, however, have been immense. The *Hornet's* loss was one killed and four wounded, and the damage received by the ship herself but inconsiderable.

Although the next naval combat did not terminate in a manner so grateful to the feelings, or so flattering to the pride of the people of America, yet no stain was affixed by it on the arms of their country. Nor was it marked by the least want of gallantry or naval skill. On the other hand, the highest qualities of the hero and the officer were eminently displayed. The action was fought on the first day of June, between the United States frigate the *Chesapeake*, of thirty-six guns, commanded by the gallant captain Lawrence, late of the *Hornet*, and the British frigate the *Shannon*, of thirty-eight guns, commanded by captain Broke, one of the most distinguished officers his country can boast. The *Shannon* was the finest and heaviest vessel, her crew under excellent discipline, well known to their officers and to each other, and perfectly acquainted with every circumstance and quality of the ship, in consequence of having been cruising in her for several months. The *Chesapeake*, on the other hand, never ranked high in the American Navy. She was now but a few hours out of port, and captain Lawrence himself, many of his officers, and most of his crew were in her at present, for the first time. It is no misrepresentation or fictitious apology to say, that an entire want of discipline for action prevailed on board. Nor, considering every thing, could it possibly be otherwise. The whole establishment had been lately got together, and was, therefore, new. The officers were unknown to the crew, the crew to one another, and both officers and crew were unacquainted with the ship. Other considerations, too, marked the moment as inauspicious for battle. Under all these circumstances, which were notorious to every one, although the *Shannon* appeared in the offing of the harbour where the *Chesapeake* lay, virtually and intentionally challenging her to a meeting, captain Lawrence would have been perfectly justifiable in declining the invitation. But the gallantry of his spirit spoke a different language. An enemy's ship was riding in view, purposely insulting the flag which it had long been his pride and glory to protect. Waving all considerations, therefore, except such as were suggested by an exalted and chivalrous sentiment of honour, he threw himself at

once on his valour and his fortune, and gallantly accepted the proffered combat.

Considering its duration (for it did not continue more than fifteen minutes) the conflict was sanguinary, in a degree, which does not, we believe, admit of a parallel. On board of the American frigate were forty-eight killed and ninety-eight wounded, (total 146;) on board of the British, twenty-six killed and fifty-eight wounded, (total 84.) By a singular fatality which seemed to hang over the moment, every officer belonging to the Chesapeake, on whom could devolve the command of the ship, was early in the action either killed or wounded. Among the latter were the gallant Lawrence himself, and Mr Ludlow, his first lieutenant, an officer also of exalted promise, both of whose wounds were mortal. In this state of things, although the crew, under the direction of the petty officers, continued to fight with great desperation, some disorder and confusion at length began to prevail among them. Observing this, and availing himself at the same time of the effect of an accidental shot, which, by cutting away one of the sails of the Chesapeake, brought her immediately foul of the Shannon, captain Broke boarded, at the head of about forty of his crew, and was instantly joined by a stronger detachment, who threw themselves on board from another quarter of the ship. The conflict on the deck was fierce, but momentary. Owing to the want of officers to lead them to the charge with regularity and effect, the Americans were overpowered, and their flag pulled down, though not by themselves. Even in this affair, unfortunate as it was, the superiority of American gunnery was evident. While the hull of the Chesapeake was scarcely marked by the shot of her antagonist, that of the Shannon was so severely shattered, having received several balls between wind and water, that she could not have sustained the conflict for ten minutes longer. Notwithstanding the constant use of her pumps, and every other practicable measure for her safety, the utmost apprehension prevailed that she would go down in the course of the following night.

Even to an enemy, we would much rather be the awarders of praise than censure.—But truth must be recorded. In the present instance the conduct of the conquerors, besides being marked by atrocity in some respects, was far from being liberal or magnanimous in any. To say nothing of their unmanly use of the sabre, after submission on the part of their enemy ought to have returned it into the scabbard, they seized as booty many articles of private property, which a generous reciprocity should have prompted them to spare. When the Java became a prize to the gallant Bainbridge, not an article of the private effects of any British officer, which had not fallen a prey to the ravages of the battle, was wrested from him. The high-minded Decatur had purchased, at a liberal price, the whole band of musical instruments belonging to the Macedonian, and the private stores of her commander, captain Carden. Lawrence himself had been lavish in his attentions to the surviving officers and crew of the Peacock. On that occasion, even the brave American tars had generously clothed their naked enemies from their own wardrobe. But, on the officers and crew of the Shannon, these magnanimous examples were entirely lost. The noble Lawrence lay expiring of his wounds, leaving behind him a helpless family, in but moderate circumstances. Having provided himself for a long cruise, his private stores were of considerable value. When application

was made to the commanding officer of the Shannon (captain Broke himself being dangerously wounded) for permission to retain this property for the benefit of Mrs Lawrence and her fatherless infants; the request was not only refused, but treated with unfeeling mockery and insult. Nor is it understood that captain Broke, since his recovery, an event on which we heartily congratulate both himself and his country, has ever remedied, or in any way noticed this unworthy and unofficer-like proceeding.

When the capture of the Chesapeake was announced in London, the whole metropolis was electrified with joy. The city was illuminated, the bells rung, the tower guns fired, and every other mark of public rejoicing most pompously displayed. Even on the floor of parliament the achievement was eulogized, as more signally glorious to their naval arms than any other conquest of a single ship that had ever occurred.

This pomp of rejoicing in the capital of the empire was by far less flattering to Britons than to Americans. On the naval skill and prowess of the latter, it constituted the highest encomium the world could bestow. To rejoice thus triumphantly, at the capture of *whole fleets and armies*, has been the practice of Britons, in common with the people of other countries. But such public and extensive demonstrations of joy, in consequence of a victory over a single ship, has no precedent in the annals of the nation. The reason of all this is perfectly obvious. The feelings of the people had been galled almost to madness, and their naval pride humbled to the dust, by the uninterrupted and unexampled series of American triumphs at sea. Fortune had favoured them at length with a smile, and they were now elated to a delirium of joy, at a solitary instance of success over the arms of a people whom they had begun to think invincible.

To counterbalance, in some measure, the multiplied triumphs of the Americans at sea, the British were almost uniformly successful in their operations by land. The surrender of general Hull, which has been already noticed, was followed by the disasters sustained in succession by the armies of the United States, at Queens-town, at French-town, before fort Meigs, and in the vicinity of fort George. These unfortunate affairs, when properly considered, whatever disgrace they may entail on the administration of our government, throw none on our country. They prove to demonstration, if proof had been wanting, that newly levied troops, whether regulars or militia, are not to be relied on, and that the strength of an army consists in discipline and experience, rather than numbers. In every instance where the armies met, the Americans were numerically equal to the British. Nor did they manifest the least inferiority in personal courage. On many occasions their spirit was proudly and chivalrously daring.—But they were deficient in what constitutes true and effective military strength—discipline in the soldier, and experience in the officer. They suffered, moreover, at times, from the want of wholesome provisions and proper clothing, and were but scantily supplied with the munitions of war. When a country, that has long reposed in the lap of peace, is suddenly and unexpectedly invaded by a foreign or neighbouring power, the government is perhaps to be held excusable for not being provided at first with an efficient army. They are taken by surprise, and, till troops can be enlisted and trained to the field, must make the best resistance in their power by volunteer

hands, or new levies and conscriptions from the mass of the people. But no terms can express with sufficient force the folly and madness of that government, which, without an army of disciplined troops, or a single officer of experience in the country, plunges of choice into an invasive war. Such a government stands justly chargeable with all the slaughter which ensues among their troops, and all the disgrace attendant on defeat, in consequence of a want of preparation for the field.

Of the few instances in which fortune smiled on our operations by land, the most distinguished were the capture of York, and the repulse of the British army at Lower Sandusky. In the latter instance, the youthful but distinguished colonel Croghan, without sustaining any material loss of men, earned for himself a wreath of unfading laurels, by his gallant and successful defence of his post against a combined force of British and Indians, consisting of more than five times his numerical strength. In the former, the victory was dearly purchased, by the death of Brigadier-General Pike, the pride and favourite of the army, who fell by the explosion of a magazine, to which the enemy intentionally set fire as they were commencing their retreat. Many other gallant exploits of border warfare occurred, marked, as was to be expected, by varied success. As they were mostly, however, on a subordinate scale, we do not feel it our duty to record them.

From this brief notice of our disasters by land, and the reflexions in which we have chosen to indulge ourselves in relation to their causes, we return to dwell once more on the brilliant career of our little navy.

On the 5th of September, a meeting took place between the United States brig of war, the *Enterprize*, Lieutenant Burroughs, and his Britannic Majesty's brig of war, the *Boxer*, captain Blythe. In metal and men, the two vessels were a perfect match. But great was the disparity of their execution in the conflict which ensued. The *Boxer* was reduced to a wreck, and triumphantly carried in forty minutes, the *Enterprize* being damaged only in her spars and rigging. The difference in the number of their killed and wounded was equally great. Each vessel, however, had the misfortune to lose, about the same moment, her gallant commander. Blythe expired instantly, being cut almost in two by a cannon ball; but Burroughs, having received a musket ball through his body, survived the action about eight hours.

The name of Wolfe, will descend with lustre to the latest posterity, no less in consideration of the manner in which he met his fate, than in consequence of his distinguished achievements while living. In no respect, however, was the death of the British general more heroic, or more affecting, than that of the young American Lieutenant. Wolfe expired in the moment of victory, declaring himself "contented," because the arms of his country were triumphant. Burroughs fell when the ball struck him, but still retained his station on the quarter deck, peremptorily refusing to be carried below, till he had received the sword of his vanquished enemy. He then with all the firmness and complacency of the dying hero, declared himself "satisfied" with the lot which had befallen him, in as much as the flag of his country had triumphed under his command. It is interesting to state, that his body, and that of his gallant foe, two illustrious rivals for conquest and glory, received the same funeral honours.

VOL IV. PART II.

The superiority of the Americans in combats between single ships was now reduced to perfect demonstration. Incredulity itself could no longer deny or question the fact. The capture of the *Guerriere*, the *Macedonian*, the *Java*, the *Frolick*, the *Peacock*, and the *Boxer*, amounted to irresistible evidence in its favour, and nothing to countervail it could possibly be inferred from the affair of the Chesapeake.

To determine, however, the point of maritime superiority generally, the number and force of the parties being equal, an important question remained to be solved. Are the Americans sufficiently versed in naval tactics to cope with the British in an engagement by squadrons?

On the 10th of September this political problem was solved to universal conviction by Commodore Perry, commander in chief of the American naval establishment on the waters of Lake Erie. The British force was commanded by Captain Barclay, an officer of distinguished gallantry and skill. A few minutes before 12 o'clock of this day, the remembrance of which will be proudly cherished in the hearts of our countrymen as long as national glory shall be dear to them, the squadrons met, the American being superior in the number of vessels, but the British by one-sixth in the number of guns. In numerical force of men the British had also a decided advantage. For four hours the battle raged with the most determined resolution and sanguinary effect on both sides, when the whole British squadron struck their colours, not a single vessel being able to escape.

In the course of this action Commodore Perry, in the sloop of war the *Lawrence*, of twenty guns, performed every thing short of a miracle. A protecting Providence must have covered him with its shield or turned aside the balls which flew in thousands around him, else he could not as he did, have escaped unhurt. The remainder of his vessels being unable to come to his aid, in consequence of the calm which prevailed for a time, he sustained in his single ship, for more than two hours, within the reach of canister shot, the fire of the whole British squadron. When at length the *Lawrence* was rendered unmanageable and useless, every brace and bowline being shot away, and all but seven of her crew either killed or wounded, Perry, alike undaunted and self possessed, left her in an open boat, completely exposed to the enemies' guns, his flag which he carried along with him still waving proudly over his head, and repaired on board the *Niagara*, the next most powerful vessel of his squadron. At this auspicious moment the wind springing up enabled him again to press forward, and break through the enemy's line, raking each vessel as he passed ahead of her with a well directed and destructive fire. His smaller vessels at the same time coming gallantly into close action and dealing death in every direction with their canister and grape, the fortune of the day was speedily decided. Had circumstances enabled the Commodore to bring his whole force to bear on the enemy at the commencement of the action, the victory would have cost him but a short struggle. It would have been less glorious, indeed, to himself, inasmuch as it would have afforded him no opportunity for the full display of the exalted qualities and wonderful resources of his mind. But it would, at the same time, have proved much less destructive to the gallant crews he had the honour to command.

4 Y

It might be thought vain glorious in us, as Americans, were we to compare the battle of Erie with the stupendous affair of Trafalgar, of Copenhagen, or the Nile. The events, we acknowledge, are on a very different scale, and it is difficult, therefore, to draw a parallel between them. We venture, however, to assert, that, considering the means which their respective governments had put into their hands, the victory of Perry will bear a proud comparison with the most splendid achievements of Nelson, the boast of the British navy. The great veteran admiral, in the whole of his illustrious career on the ocean, never exhibited more heroic firmness, or higher qualities for command, than were displayed on Lake Erie by the youthful Commodore. Naval history, moreover, will be searched, we believe, in vain for a single instance in which a ship was ever before defended with a spirit so truly invincible as that which was manifested in the defence of the *Lawrence*. That vessel fought against more than treble her number of guns, and five times, at least, her number of men. Early in the action every brace and bowline were car-

ried away. In this crippled state, against such stupendous odds, for upwards of two hours did she continue the action, till not a gun was left in a condition to be pointed at the enemy, and all but seven of her brave defenders were either killed or wounded. Had Americans never fought or defended a ship before, this instance alone would have been amply sufficient to immortalize their character.

In the great events which have lately occurred and are now daily passing on the continent of Europe, and which appertain of right to the present article, we feel a sincere and lively interest. We consider them as essentially connected with the interest and prosperity, the freedom and happiness, of the civilized world. They have as yet, however, reached us only through the channel of report, and not accompanied with sufficient evidence to convert them into history. This is our apology for not introducing them on the present occasion, and we hope that, by an enlightened public, it will not be regarded as without foundation.

CALDWELL.

BRITAIN, New. See LABRADOR.

BRITAIN, New, the name of a considerable island in the South Pacific Ocean, situated at the eastern extremity of Papua or New Guinea, from which it is separated by the straits of Dampier, so called from the navigator who first explored this island. New Ireland is a long island, situated to the east of New Britain. The general aspect of the island, which is well peopled, is woody and mountainous, enlivened with beautiful streams and fruitful valleys. Cocoa nuts, yams, ginger, and other roots, are among the productions of New Britain. There are several volcanoes, both in this and in the circumjacent islands. Latitude between 4° and 6° south; and longitude between $148^{\circ} 20'$, and $151^{\circ} 20'$ east. See NEW GUINEA. (w)

BRITTANY, or BRETAGNE, one of the old provinces of France, bounded by Anjou, Normandy, and the Main on the east, by Poitou partly on the south, and by the sea on the west and north, so as to form a peninsula.

Brittany was formerly one of the most considerable provinces of France, both from its extent, and from the number and riches of its inhabitants. It stretched about 65 leagues from east to west, and about 44 from north to south. Its extent, according to Necker, was 1174 square leagues, or 1801 according to a later writer, M. Bonvallet Desbrosses. The first of these authors reckons the population at 2,276,000, being 1282 inhabitants for every square league; while the latter makes it 1,620,900, which gives only about 900 souls for every square league.

The climate of Brittany is mild, excepting near the coast, where the air is loaded with vapours. The soil consists chiefly of a gravelly sand, and the face of the country is diversified with hills and plains. In many parts there are extensive heaths, like those of Cornwall, some of which are covered to a great extent with forests of wood.

The principal productions of this province are, wheat,

barley, oats, rye, flax, hemp, and wood. In the fertile districts of Vannois and St Brioux, about one half of the barley and rye was exported to Spain and Portugal. The wines of Brittany are chiefly made in the neighbourhood of Nantes and Rhys, and are generally consumed in the province; but when they are manufactured in great quantities, a considerable portion of them is converted into brandy. The annual consumption of wines sent from Bourdeaux was 30,000 tonneaux, each of which contains 460 Paris pints.

The forests of Brittany, which consist of oaks, beeches, chesnuts, &c. contain about 161,046 journaux, and 36 cordes.* Great numbers of cattle, and particularly cows, are fed in the pastures, and a considerable commerce in butter is carried on with Anjou. Yellow wax of the very best kind is made in Lower Brittany, and about 150 thousand weight is annually sold. Mines of lead are very abundant. The principal ones are at Carnot, Pontpean, Carcé, and Poullaouen. The iron mines are also very considerable, but they have not been wrought to any great extent. At Penhouet, where the river Oudon discharges itself into the Vilaine, there is an excellent quarry of slates, which was let at 15,000 livres a year, for nine years, and which can employ about 200 workmen, who manufacture nearly 50,000 weight a day. This slate, though smaller than that of Nantes, is sold at Rennes at 22 francs for every thousand weight. In the canton of St Nazaire, there is a field filled with loadstones. Those which lie on the surface have very little force, but those which are found below the surface are remarkably good. The compass, as might be expected, is subject to singular variations in this part of the country. Salt is made in great quantities in the villages on the bay of Bourgneuf, and in the territory of Guerande and Croisic. In common years, the quantity of salt which is manufactured amounts to 40,000 muids, each muid containing 144 minots, and each minot 100 pouds de marc. Supposing the value of each muid to be 100 francs, we shall have 4,000,000

* A journal is 80 square cordes. A linear corde is 24 feet, and a square corde 576 square feet, or 16 toises.

francs for the value of the salt which is annually produced. A very considerable fishery is carried on, on the coasts of this province; about 30 or 40 boats are employed in the fishing of the congo, or conger eels, of which nearly 400 quintals are caught every year. Those which are not consumed in the province are sent to Bourdeaux, and are sold at the rate of 10 or 20 francs per quintal. The fishing of sardines and mackerel is carried on to a great extent at Port Louis, Belleisle, Audierne, and Brest, and great quantities are exported to Provence, Spain, Portugal, and to every part of the Mediterranean. Port Louis alone sells about 4000 barrels of sardines, and the inhabitants of Belleisle make about 1000 or 1200. There is a salmon fishery at Chateaulin, which rents at about 4500 francs annually.

The principal manufactures of Brittany are sail-cloths and cordage, fine cloths, and woollen stuffs. The principal rivers are the Loire and the Vilaine, which are united with the Ronce, or Drance, by means of a canal between Rennes and Dijon; the Coesnon or Couesnon, which is navigable for six or eight months of the year from the sea to the port of Angle; the Andre or Endre, which is navigable after it receives the waters of the Mandée; the Alne, which falls into the bay of Brest, and might be rendered navigable by sluices as far as Carhaix; the Morlaix; the Odes; the Blavet, and the Ille. The principal ports of Brittany are Brest; Nantes, St Malo, St Brieux, L'Orient, Vannes, Croisic, Port Louis, and Treguier. This province now forms the departments of Ille and Vilaine, Cotes du Nord, Finistère, Morbihan, and the Lower Loire, which see under their respective names. (j)

BRIXEN, the *Sublavo* of the ancients, the capital of a district of the Tyrol of the same name, situated in the midst of hills and vineyards, to the south of the Brenner Mountains, at the confluence of the Rientz and Eysach. This place, which has not much of the appearance of a town, but rather resembles the village-like capitals of the democratic Swiss cantons, is well built, and the houses, which are painted, are adorned with piazzas. The public buildings are excellent, and the town has the advantage of several spacious squares. The palace of the bishop is rather mean, though capacious and well built. In the cathedral, the cloisters of which are covered with inscriptions, there are several paintings by the first Tyrolese masters, and particularly by the Unterbergers. The principal altar of the parish church, the painting of the crucifix by Schoepf, a pupil of Knoller, and the house for English ladies of rank, are among the principal objects deserving of notice at Brixen. Besides the cathedral, there are six other churches, of which the Benedictine church is the finest. The town is governed by its own magistrates, viz. two burgomasters, and two counsellors. The mineral waters in the neighbourhood are much frequented; and at Klausen, about three leagues from Brixen, there is a fine collection of paintings in the convent of Capuchins. The principal article of commerce is the red wine made in the surrounding country. East Long. 11° 50', North Lat. 46° 35'. See Drummond's *Travels*, p. 16, and Kuttner's *Travels*. (w)

BRIZA, a genus of plants of the class Triandria, and order Digynia. See BOTANY.

BROADWOOD'S Temperament of the Musical Scale. For several years past, Mr James Broadwood, a piano-forte maker in London, has been celebrated for the ex-

cellence of his instruments, as to perfection of workmanship and tone; and he has been supposed, also, to employ the best set of practical *tuners*, for attending to the tuning of the instruments of his customers at stated periods: in pursuance, therefore, of the notice we gave at the end of our article BEATS, of our intention to present our readers with an account of all the most celebrated systems or methods of tuning keyed instruments that are known, constituting the most curious and important part of the science of harmonics, we avail ourselves of a communication which Mr Broadwood lately made to the Monthly Magazine, (Vol. XXXII. p. 106; see also pages 238, 321, and 424,) to give what that gentleman calls his "practical method" of tuning, which we shall do in his own words; inserting, in parentheses, the numbers of *beats* made in one second of time, by the several tempered fifths that are to be tuned, as they result from our calculation, which will be given at length below, along with some other matters, by way of explanation.

Mr Broadwood, after mentioning that most tuners begin their operations with the note C, says, "I prefer tuning from A, the second space in the treble cliff, as being less remote from the two finishing fifths, than any other point of departure: the A being tuned to the *forte*, (that for this particular temperament should make 403.0443 complete vibrations in one second of time,) tune A below an octave; then E above that octave, a fifth (beating *flat* .9744 times in one second); then B above, a fifth (beating 1.4598); then B below, an octave; then F♯ a fifth above (beating 1.0929); then its octave F♯ below; then C♯ its fifth above (beating .8183); then G♯ its fifth above (beating 1.2258); and then G♯ its octave below.

We then take a fresh departure from A, tuning D its fifth below (beating *flat* 1.3017); then G its fifth below (beating .8692); then G its octave above, then C its fifth below (beating 1.1618); then C its octave above, then F its fifth below (beating 1.5501); then B♭ its fifth below (beating 1.0350); then B♭ its octave above, then E♭ its fifth below (beating 1.3826). The five *fifths* tuned from notes below are to be tuned flatter than the perfect fifth, and the six fifths tuned from tones above must be made sharper than the perfect (i. e. the lower note is to be sharper than for a perfect fifth, thereby making the interval of the fifth flatter than the perfect as before), in a proportion I will endeavour to explain. If the whole be turned correctly, the G♯ with the D♯ (which is the same tone on the piano-forte as E♭) will be found to make the same concord, that is, possesses the same interval as the other *ffths*," but, we must observe, it is impossible that it should do this, since this bearing or resulting fifth will beat 1.3943 sharp, instead of .9175 *flat*, which it would beat if E♭ were altered to the same interval as the other fifths (or rather if it were made D♯), or .9231 *flat*, if G♯ were altered to such interval (or rather, made A♭), but in either of these cases, it will be seen, that the former tuning would be undone and spoiled; but we must return to Mr Broadwood, who says, though not correctly, p. 107, "the old system of temperament (having a quint wolf, on douzeave instruments) is now deservedly abandoned, and the equal temperament generally adopted;"—"suppose two strings B and C, in the middle octave of the piano-forte, to be, one a full semitone from the other," (we have here used the major semitone S, or $\frac{1}{2}$, which is the interval B C in the natural or diatonic

scale of all correct singers and violinists, and on the Rev. Henry Liston's patent organ, without any temperament in its harmony, now exhibiting at Flight and Robson's in London, being VIII-VII. See the *Philosophical Magazine*, Vol. XXXVII. p. 273, "with your hammer," says Mr Broadwood, "lower down, or flatten C by the smallest possible gradations, until it becomes unison with B; with a tolerably steady hand, and a few trials, you will be enabled to enumerate forty gradations of sound, which I call *commas*." Now, any one unacquainted with the subject, would think from this, that Mr Broadwood had discovered some hidden property of the full semitone, as he calls it, which disposed it to divide into just 40 smaller intervals, that the ear could appreciate so distinctly as to enable the tuner to make these commas all equal, than which nothing can be farther from the fact. Although he continues, "after having, by a little practice, acquired a distinct and clear idea of the quantity meant to be represented by the term comma, nothing more will be required to make the proper fifth, (for the temperament as above), after having tuned the fifth a perfect, or violin, or singing fifth, than to flatten the said perfect fifth, by lowering the string supposed to be tuning (the upper string), one of the afore-described commas;" yet we may further add, without fear of being contradicted by the results of impartial trials, that without counting the *beats* which we have given above for that purpose, it is impossible for any tuner, however practised or expert he may be, to approach this system within tolerable limits: When we say within tolerable limits, we mean such as are essential to the discrimination of one system from another, and of exhibiting the peculiarities of each, which are sufficiently distinguishable, when the tuning is correctly done, by the beats, a monochord will not do it, as we shall shew in the article *SONOMETER*: Much less can the thing be effected *by the ear*, directing the "mere mechanical operation" of the tuning-hammer, (or winch used to tune the pegs on which the wires lap,) as Mr Broadwood maintains, in a subsequent number of the *Monthly Magazine*, above referred to: and where, with equal pertinacity, he insists, that an *equal temperament* is produced by these commas of his: It is true, as Mr Farey has there observed, that Mr Broadwood has not expressly defined his "full semitone," to mean the major semitone; but it is certain, that the ear could not discriminate the semitone or interval ($40\Xi + 3\frac{1}{2}m$) or its parts, of which one-fortieth (1.0006552Ξ) is the proper *isotonic* temperament, nor could it better appreciate another interval, ($48\Xi + 4m$, or $4\text{ } \frac{1}{2}\text{ } \Xi$) or its parts, of which one-fortieth or 1.200786Ξ ($= \frac{1}{40}\text{ } \Xi$ or $\frac{3}{2}\Xi + \frac{1}{10}m$) answers to the system of 12 equally-tempered fifths, but one of them *sharp*, which just occurs to us, without having been any where described, as far as we know, of which we shall say more under *EQUAL-TEMPERED FIFTHS*; and which it is not very probable that Mr Broadwood intended, considering the degree of contempt with which

he affects to treat the mathematical and only true or satisfactory method of treating this subject, which we are so anxious to see more generally understood by professors of music in general, and which would prevent them from being the dupes of every random or interested proposition respecting temperament, which is brought forwards.

As this temperament of Mr Broadwood's of which we are treating, or some other, which perhaps by chance, and without any fixed principle, his tuners practise, has obtained considerable celebrity in London, and being also the first that has occurred to be described in our work, we trust that we shall be excused by our more learned readers, for setting down the whole of the operations necessary for obtaining the *vibrations* and the *beats* of this system; as an example of the rules that we intend to submit, for enabling those to understand and perform all the necessary calculations, who are acquainted only with common decimal arithmetic, the use of the algebraic signs $+$, $-$, \times , \div , and $=$, (for addition, subtraction, multiplication, division, and equality,) and the use of the common Tables of logarithms, (of which *Callot's* stereotype are the best,) than which nothing is more easy than to acquire a knowledge and facility in their use; and to which we are the more induced, from there being no works extant, to which we can refer, for familiar explanations or examples of the calculations necessary in considering musical temperaments.

By a reference to Plate XXX., in Vol. II., and article *APOTOMX*, where it is explained, it will be seen that the reciprocal logarithm, or recip. log. of S, or the major semitone, is .0280287,2. This, divided by 40, or removing the decimal point one place to the left hand, and dividing by 4, we get .0007007,2, the recip. log. of the flat temperament of the fifth, in Mr Broadwood's system, $= 1.4297244\Xi$: and, from the same Plate, we get .1760912,6, (not .17669, &c. as there engraved by mistake,) the recip. log. of V, or the fifth; the difference of which two last numbers is .1753905,4 $=$ the recip. log. of the tempered fifth, to be added, wherever, according to the preceding directions, the tuning of it is upwards, and subtracted wherever the same is downwards, as in columns of the following table; in which the VIII $= .3010300,0$, is added when an octave is directed to be tuned upwards, and subtracted when the same is to be tuned downwards. It is right here also to explain, that the logarithm of the vibrations of the note A, at the beginning, and in the middle of the first column of the table, has been assumed by previous trial, or working backwards, such, that the note C may have a log. of 2.3802112,4, answering to the number 240 of vibrations, which is understood to be the present *CONCERT PITCH*, (see that article,) and to which the pitch of the instrument to be tuned, must be carefully adapted, according to the rules that will there be given, (see also Dr R. Smith's *Harmonics*, prop. xviii.) otherwise the beats here calculated will not apply.

			= 1.3943*

The first column in the above Table or process, had better be calculated through, as above directed, and written wide, before proceeding to the second, and let the resulting log. of G* be deducted from that of Eb, which, in the present case, will give .1779140,6 for this bearing or resulting fifth, from which, taking the perfect fifth .1760912,6, we get .0018228,0, the recip. log. of the quint wolf or sharp and fifth in Mr Broadwood's system, = 3.719106Σ; and by reference to Mr Farey's 15th corollary in the *Philosophical Magazine*, vol. xxxvi. p. 374, or to our article TEMPERAMENT, we find that 11 × temp. of V — d, ought to give this same Vth wolf; or, 11 × .0007007,2 = .0058851,4 = .0018227,8; which differ-

ing only 2 in the eighth place of logarithms, shews that all the several operations in this column have been correctly performed; otherwise they must have been gone over again and corrected. We next proceed carefully to take out the numbers in the logarithmic Tables, answering to the several notes marked by the letters in front of the first column, and place them opposite in column two, after the sign =; the next operation is, to halve all these numbers where an octave has been tuned downwards, as from A, B, F* and G*, which are to be placed below (and opposite to their respective logs.) in the first half of the Table, and to double all those where an octave has been tuned upwards, as from G, C, and

Bb, to be placed also below, in the lower half of the table, as the letters placed after the second column indicate.

We now turn to the new and correct theorem for calculating BEATS by our 4th method, and multiply the least number of vibrations by 3, and the greatest number by 2, (the terms of the ratio, $\frac{3}{2}$) in each corresponding pair of vibrations of the fifths, and place the products below and above in the intervals in column 2; by which means two numbers nearly alike will come together, ready for subtracting to obtain the beats, that are set opposite in column 4, to each of these pairs of products; by which process, all the trouble and risk of mistakes in transcribing numbers are avoided, and the whole operation may be preserved for future use or revision. The products for G \times and Eb, at the two extremities of the parts of the Table, may easily be deducted to obtain the beats, where they stand, and without transcribing. Methods so very simple and easy as these, of obtaining the beats of the fifths, (and of all the other concords by the same theorem that has been referred to,) to the utmost degree of exactitude, will, we hope, stimulate many to apply them in the calculations on other systems, who have been deterred by the very operose method hitherto known and recommended for the purpose. In practice, the index and decimal point of the logarithm, in column 1, may very well be dispensed with. (g)

BROCADE, in the manufacture of cloth, signifies that species, in which a certain portion of woof is interwoven, in order to produce fanciful variety upon particular parts of the superficies of the cloth. In this respect it may, without any violation of propriety, be taken as a generic term, under which all the varieties of spot, or japan weaving, may be included. As an article of commerce, it can never be of material importance, in a country where the wages of labour are necessarily so high as they are in Britain; for hitherto, at least, no attempt to introduce the aid of machinery has been in any degree practically successful, and the tedious and fatiguing process of mere manual labour will ever preclude competition with those showy, although flimsy and inferior substitutes, which can be afforded at less than one-third of the price. This manufacture, and the whole range of spotting, differs from the damask, and other ornamental kinds, in this respect, that the woof is only interwoven, where the figure is to be formed, an entirely distinct woof being employed to form the ground-work of the fabric. The requisite machinery for this purpose will be found by referring to Plate CIV. Fig. 1; and the remaining figures will serve to illustrate how far the difference between brocade, japan, and common spot weaving, consists in the construction and mounting of the loom; and how far, subsequently, in the manner in which the loom, when mounted, is employed by the operator. In what is properly termed the brocade, or finger flower, the whole of every flower is interwoven merely by the hand, and this constitutes the enormous expence; resembling, in some degree, that species of weaving which has been brought to such a wonderful degree of perfection on the continent, as in many instances to rival even the most masterly efforts of painting, and which is distinguished by the name of *Tapestry*.

The general appearance of a brocade loom, Plate CIV. Fig. 1, which is a horizontal plan, will serve to convey some idea. In this figure, the warp is only represented where the figures are to be shown; the remaining warp being, in every respect, similar to that of plain or alter-

nately woven cloth. When the warp is opened for the common texture, the woof is interwoven exactly as in a plain fabric; and where a figure is to be formed, a separate body of woof, much coarser, is passed, by the operation of the hand, through those portions of warp which are successively opened, according to the form of the design or pattern. These two operations are performed alternately, and thus the fabric is formed, the general texture being effected by a shuttle, and the ornamental by manual labour. In the general mode of performing this, the weaver is assisted by a boy or girl, who sits along with him, and assists him in passing the ornamental woof through the warp which is raised. If, in Fig. 1, A, B, and C, are supposed to consist of three portions of warp, set apart for the ornamental figure, and if it be also understood, that any number of these may be included in one web, according to its breadth, its fineness, and the number and magnitude of the flowers required, the general principle will be at once comprehended. Let the heddles, which open the warp be represented at DD, and suppose every other part to be exactly similar to any other common loom, the lay being entirely omitted. Any portion of the warp may then be opened, by raising the particular heddles; and when this is done, the ornamental woof which forms every flower may be passed through by the weaver and his assistants. Let plain woof be then passed through to form the general fabric, and the desired effect must be produced. This is of itself sufficiently obvious; but the means by which it is reduced to practice, and the drawings which practical artificers use as guides, are of importance to those who are professionally obliged to use them; and these will be found in the horizontal plan; for which see Fig. 2. Plans of this kind will not only convey a very inadequate idea of what is intended by them, but would really mislead any man, only conversant with the rules of mechanical drawing. They are, however, those to which professional weavers always have recourse; and it is, therefore, necessary, in order to prevent confusion of idea, and even positive error, to explain their principle. They may be considered as horizontal plans of a weaving loom, but they consist of two entirely separate and unconnected parts, which are placed together merely for the sake of conveniency. If we can suppose that an architect, for the use of practical builders, would plan two separate floors of a house, and represent them as parts of two adjoining houses, the idea will be at once correctly formed. Thus, the right hand part of the figure, from A to B, represents the heddles, and the left hand part, from B to C, the heddles which, in actual practice, are really perpendicularly under the former. The first of these, namely the portion from A to B, represents what is termed the draught of a web, or that order of succession in which the warp is inserted in the different leaves of which the heddles consist. The second portion from B to C serves to guide the person who arranges the machinery of a loom, how to form the connections between the heddles and the levers, or treadles, by which they are to be moved. In the article CLOTH MANUFACTURE, the general principle of connection, and the ranges and powers of the respective levers, will be found sufficiently explained; their particular application, therefore, is only necessary in this place.

For the draught of the warp, or its order of insertion in the heddles, it is, in the first instance, necessary to ascertain whether the two sides of the pattern are similar, or dissimilar; for in the former case only one half

of the heddles will be requisite, which are indispensable in the latter. By similarity of the sides, the following meaning is to be understood. Let an ornament or flower consist of any given number of threads, as 20, 40, 60, 80, or 100; then if, in the first instance, the 10 threads to the left form an appearance exactly similar to the 10 threads to the right, but inverted upon the cloth, the pattern is similar, and may be wrought with 10 leaves; if not, it is dissimilar, and will require 20, exclusive of what may be requisite for plain cloth in either instance. The pattern in the figure is dissimilar, and therefore requires twice the number of leaves which would be necessary in one diverging equally from the centre. In this pattern, 25 leaves are used, independently of that in the front, through which every alternate thread is drawn, in order to form the ground of the fabric. Hence, if plain cloth be required, as it is in the intervals between the flowers, the aggregate of the 25 leaves, including one half of the warp, while the front leaf singly contains the other half: these two, wrought alternately, will produce the plain, whilst the others may be so varied in succession as to form any flower whatever, whose range does not exceed the number of threads contained in those leaves. The draught of the warp is uniform and successive from left to right, and hence the whole fabric may be covered with flowers if required; or the weaver may, at his discretion, fill only every second, third, or fourth, with the ornamental woof, and thus produce a pattern richer or slighter, as may be found convenient.

The number of treddles necessary are 22. Of these, the two represented at the right hand, and distinguished by the letters A, B, are intended for the plain part of the fabric; for A, when depressed, will raise the front leaf, containing one half of the warp, and B will exactly reverse the effect, sinking the front leaf and raising all the others. The remaining treddles, when used, will raise in varied succession the ornamental part, and produce the pattern intended. The cross lines drawn in the figure are very similar to those in the design paper, which is the general rule by which weavers are directed in their operations; and a copious account of which, illustrated by references to the most extensive species of ornamental workmanship, will be found in the article CLOTH MANUFACTURE. Let whatever part of the pattern, where the warp is to be raised above the woof, be represented by the marks and dots upon the intersections of the heddles and treddles, and an exact rule will be given to the weaver for the application of his raising cordage. In a part of these the whole intersection is filled, which assimilates the appearance to that upon design paper; in the remainder, dots only are used, which is the way generally adopted in actual practice. These marks, therefore, denote raising cords, and where no mark is applied, sinking cords are to be used; so that the whole warp may be effected either in one or the other way, by the pressure of every individual treddle. Upon this general rule depends the formation of every flower which can be woven upon cloth, whether incorporated into the fabric, as in damask, or effected by separate woof, as in brocading.

The cording marks, in plans of this description, may in general be reduced to three different descriptions:

1st, Those in which every part of the figure is independent and dissimilar.

2d, Those in which the two sides are similar, but where the top and bottom differ.

3d, Those in which every part diverging from the centre, is similar to that opposite to it.

Of the first of these, the figure to which reference has been already made, is an example; and this, whether woven as a brocade, or as a spot, is the most comprehensive kind.

In Plate CIV. Fig. 3, will be found an illustration of the second; and this we shall suppose is to be woven like what is termed a common spot.

Spotting, in point of show and effect, is considerably inferior to brocading; but its great difference in labour, and consequently in price, gives it many advantages over the former, which is much too expensive for extensive and general use. Spotting is formed by the insertion of woof much coarser than what forms the general fabric, and passes clear of every part of the texture, the figures only excepted. The intervals of the coarse woof are clipped away with scissors after the cloth is taken from the loom, and before it is sent to be bleached and finished. From this circumstance, all spots are liable to a defect in appearance, from which brocades are totally exempted. If this spot be supposed to represent a club, only one half of the figure is necessary for the plan of the cording; for in the way in which the drawing of the warp is done, two threads upon opposite sides of the Figure being inserted in the same leaf, the sides will be similarly formed by half of the mounting used in dissimilar or independent spots. The mounting here consists of two separate and independent figures, which are to be wrought alternately; and any portion of the warp being inserted in the plain leaves A and B, the figures may be either contiguous, or removed to any distance which may be thought proper. A spot where all the figures are contiguous, without any intervention of plain cloth, is called an *allover*; those where the plain spaces are equal to those allotted for the spotting are denominated *half covers*, and so of others. This spot is contained in 32 leaves, of which A and B are reserved for the plain intervals, and the remaining 30 for the two spots, 15 being allotted for each.

In Plate CIV. Fig. 4, is given the plan used for the japan or paper spot, which is more brilliant in appearance, but vastly more expensive in apparatus, and more tedious to work than the common spot. The difference of the japan from the common spot consists in the latter being as completely interwoven with the cloth as any part of the fabric, whereas the former is only raised or flushed on one side. In the common spot, therefore, each alternate thread is drawn into the same leaf, and consequently one half of the whole warp is wrought exactly as a plain piece of cloth, whilst the other half only is reserved for the fanciful or decorative part. In the insertion of the two kinds of woof, the finer sort, which forms the ground or body of the texture, is passed twice between the warp for every time that the coarse or spotting woof is used. But in the japan spot, every thread of that part which forms the figure is drawn independently, and consequently twice the number of leaves become necessary, and as, in this case, one thread of each kind of woof is alternately used, the spotting woof is as completely incorporated into the fabric as any other part of it. In the figure, the plain leaves A and B are only used for the intervals between the spots or figures; and were the pattern a complete allover spot, they would only be used for a few threads or splitfuls of warp at each side, in order to form a plain selvage or list. The marks for the order of drawing the warp through the

fanciful part of the mounting, being placed upon exactly the same plan as formerly described, a mere inspection of the figure will be sufficient for those who have studied the former plans, or who are previously acquainted with this mode of elucidation, which is universal among the best informed operative weavers of fanciful cloth, without almost any further explanation. The whole, it will be evident, may be reduced to four compartments, two being allotted for each flower; and were the flowers in regular succession, without being placed so as to form the appearance of a diamond or diagonal row, only one half of the apparatus would be necessary.

The Japan spot, although less tedious, and consequently less expensive than the brocade, is still sufficiently so to preclude it from ever becoming an article of general use, excepting with the opulent; and, consequently, it never can be an article of extensive manufacture, more especially as it is rivalled, even in point of show, by many cheaper substitutes. Abstracted, however, from the original expence, it will perhaps be found, eventually, a more desirable article, even in point of economy, than many of the more flimsy substitutes which have superseded it. To those, therefore, who can afford the original purchase, and who are not too prone to be carried away by novelty, it will be always desirable; for, in point of neatness, strength, and durability, if carefully used, it is decidedly superior to most of the light ornamental goods which are manufactured, either in India or in Britain.

Some attempts have been made to save time, and supersede the necessity of employing a boy or girl to assist the operator in *fingering* brocades, which is the term applied to the interweaving of the coarse woof by the hand. These have been chiefly confined to operative tradesmen, who, being neither intimately acquainted with those minutiae of mechanical science, which are so peculiarly necessary to guard an inventor from great error, nor of the ability to expend either much time or money in maturing their plans, were not very likely to prove eminently successful.

The competition of cheaper articles may be assigned as a sufficient reason why more opulent manufacturers could have little inducement to embark capital in the promotion of such schemes; and consequently both, after a few, perhaps insufficient, experiments, were abandoned. If a demand, however, really existed for the article, either of them seems sufficiently capable of effecting its purpose, and even of producing a very considerable saving. In Plate CIV. Fig. 5, a small additional lay, containing a number of boxes, each of which is to work a small independent shuttle, is represented. This lay has two motions. The first serves to raise or sink it at pleasure; and the second from right to left, and *vice versa*, by a sudden jerk, throws the shuttles from each box to that next it. This lay being suspended immediately in front of the large one which contains the reed, and which is in every respect the same as the common lay for weaving plain cloth, is sunk between the intervals of the warp, when the small shuttles are to be used, and by a sudden jerk all the small shuttles are thrown across. The front lay being then raised, the woof is struck home by the other lay; the fine woof for the ground of the texture is then inserted, as in plain weaving, and the operation of the small lay repeated as often as the particular form or size of the flower renders it requisite. The places for the small shuttles are dis-

tinguished by the letters AA, BB, &c. each letter being supposed to show the place of one shuttle in each of its alternate positions. As this apparatus is very similar in the general principle to that of the inkle loom, there is no reason to despair of rendering it effective, whenever a sufficient stimulus for the exertion of talent and industry is held out, by a want of the article which it is intended to produce. In its present state, it can only be considered in the light of a rude and imperfect attempt at improvement.

The other invention, which was made by Mr Austin of Glasgow, many years ago, like the former, was neglected after a partial and imperfect trial. In this, the effect, for which the small boxes in the former were designed, is produced by the revolution of segments of a circle, Plate CIV. Fig. 6. each containing a small bobbin of woof. These segments, which were composed of brass, had an aperture left sufficient to allow the warp, forming the extreme breadth of each flower, to rise without obstruction, and each segment was so constructed as to revolve freely in a groove. The circumference of each was cut like a wheel, and motion given to the whole by a rack moved alternately from side to side. Thus the bobbin intersected the open warp at every revolution, and the aperture in the segment allowed a free passage to the warp. In this, like the former, there appears rather a rude and not impracticable plan, than a maturely digested and practically efficient improvement. Both seem to require much farther amelioration; and they are inserted, rather to shew what has been done, than as complete and effective models of mechanical efficiency. (J. D.)

BROCKEN, the name of the highest of the Hartz mountains in Saxony. This mountain, which, on account of its natural curiosities, is much resorted to by travellers, may be ascended by two great roads for carriages, or by five foot-paths. The best method of ascending it on foot is to take the foot-path on the side of Schiercke, and to descend by the foot-path of Iisen-bourgh. Between Schiercke and Heinrichshöhe there are immense blocks of granite, like those of Mount St Gothard, and large tables of granite, equal to those on Mount Grimsel. In order to facilitate the ascent of the mountain, the reigning Count of Stollberg Wernigerode has cut a new road from Wernigerode, where he has erected a large and well built inn, from a design of the architect Barth, which is protected by conductors, and which resisted the terrible storm of November 1800. In this delightful inn, which, from the immense height at which it is placed, commands a most extensive view, the traveller is astonished to find all the accommodation and luxuries of the first hotels in Europe.

At the summit of the mountain there are several masses of fragments, and blocks of granite, called the altar and the sorcerer's chair. A clear spring of water is called the magic fountain, and the anemone of the Brocken is denominated the sorcerer's flower. These names derive their origin from the festival of the great idol Crotho, whom the Saxons worshipped in secret, at this immense and solitary height, while Christianity was extending her peaceful conquests over the plains below. From the highest summit of the Brocken is seen a plain about 70 leagues in extent, peopled with five millions of souls, and occupying nearly the two-hundredth part of the whole of Europe. The following are the heights of the mountain as taken by different observers:

	Old Paris feet.	
Above the North Sea, - -	3,455.	Rosenthal.
	3,163.	Lasius.
	3,022.	Zimmerman.
Above Hanover, - - -	3,246.	Rosenthal.
	3,184.	De Luc.
Above Nordhausen and Gottingen, - - - - - }	2,926.	Rosenthal.
Above Oderbrücke, - - -	1,081.	Rosenthal.
	1,038.	De Luc.
Above the old hotel, - - -	326.	Rosenthal.

The principal curiosities of the Brocken are—the insulated rock of Isenstein, rising to a height of 320 feet, and the rocks of Schnarcher, Rennecke, and Hohnklippen, which are of inferior height; the fall of the river Bode on the side of Rosstrapp; the Rosstrapp, which is a wall of rocks cut perpendicularly, and forming a precipice of from 500 to 800 feet; and the Oderbrücke, which is a dyke consisting of immense blocks of granite, which stops the course of the Oder, and makes it form a huge lake of 10,138 square toises. In addition to these objects of curiosity, the picturesque road along the Oderbrücke, the canal of Rehberg, and the grottos, called Baumannshole and Bielshole, are worthy of particular notice. The latitude of the top of the Brocken is $51^{\circ} 48' 29''$, and its longitude $28^{\circ} 16' 20''$ east from the Ferro Isles. An account of the botany of this and the neighbouring mountains may be found in Gatterer's *Anleitung den Harz zu bereisen*; and an account of their mineralogical productions will be found in Lasius' *Beobachtungen über die Harzgebirge*. See HARTZ. (j)

BROCKLESBY, RICHARD, an eminent physician, was descended of a wealthy and respectable Irish family; and was born at Minehead, in Somersetshire, on the 11th of August 1722, when his mother was on a visit to her relations. His parents, who resided at Cork, belonged to the society of Quakers, and seem to have been more anxious to imbue the mind of their son with the elements of a liberal education, than with the peculiar tenets of their sect. At the academy of Ballymore, where he went at an early age, he contracted an acquaintance with the celebrated Edmund Burke, which grew into the warmest friendship, when both of them appeared as public characters in London. After finishing his grammar education, Mr Brocklesby attended a course of medical lectures at the university of Edinburgh, and afterwards went to Leyden, where he took his degree of doctor of medicine in 1745, and delivered a thesis, entitled *De Salva Sana et Morbosa*. Upon his return to England in 1746, he settled as a physician in London; but, like all young practitioners, his time was less occupied in the practice of his profession, than in accommodating his wants to the narrowness of his income. His fame, however, began to extend, after the publication of his Essay on the mortality of the horned cattle. In the year 1751, he was admitted a licentiate in the Royal College of Physicians. The honorary degree of doctor in medicine was conferred upon him by the university of Dublin in 1754; and he received the same honour from the university of Cambridge in 1755. In June 1756, he was elected a fellow of the Royal College of Physicians.

The practice of Dr Brocklesby now began to extend

with his reputation. The mildness of his disposition endeared him to his professional brethren, while his kind attention to the wants and diseases of the poor, gained him the affections of a more extensive circle. In the year 1758, he was appointed physician to the army by Lord Barrington; and, in this capacity he served in Germany during the greater part of the seven years war. He was afterwards chosen physician to the hospitals for British forces; and he returned to London in 1763, a few months before the termination of the war. In 1764, he published, in one volume, 8vo. *Economical and Medical Observations from 1738 to 1763, tending to the improvement of Medical Hospitals*. This work, which contains the valuable results of his experience on the continent, abounds with excellent practical remarks on the history and treatment of various disorders, and with many useful hints respecting the management of hospitals.

By the death of his father, Dr Brocklesby was left an estate of 600*l.* per annum. From his profession, he derived a clear income of 1000*l.* a year, and, as he enjoyed half pay from the army, and also a pension from his friend the Duke of Richmond,* he was enabled not only to live in splendour, but to amass a very considerable fortune. Dr Brocklesby was now elected a fellow of the Royal Society. He contributed several papers to the transactions of that learned body; and his leisure hours were devoted to the society of his literary and political friends. By his advice, a professorship of chemistry was added to the establishment of the Royal Military Academy at Woolwich; and he had also the merit of recommending to that professorship the celebrated Dr Adair Crawford. About this time, the Duke of Richmond appointed him physician-general to the royal regiment of artillery and corps of engineers. The infirmities of old age, however, now began to interfere with the active duties of his profession, and induced him to abandon his medical practice, except among his particular friends. In December 1797, he went to Beaconsfield, on a visit to the widow of his late friend Mr Burke; and, on the 11th of that month, he returned to dine with his two nephews, Dr Young and Mr Beeby, of whose education he had taken the principal charge. Though a little fatigued with the journey, he talked with cheerfulness, repeated passages from his favourite classics, and appeared in his usual health; but, when he retired to rest about nine o'clock in the evening, he found the labour of ascending the stairs almost too great for him, and, a few minutes after he went to bed, he dropped asleep, and almost instantly expired, without the least appearance of pain. He bequeathed his books, pictures, and plate, with a handsome legacy, to his nephew Dr Thomas Young, now foreign secretary to the Royal Society of London, a philosopher to whom science is under numerous obligations. With the exception of these and a few other legacies, the rest of Dr Brocklesby's fortune, which amounted altogether to about 50,000*l.* was left to his other nephew Mr Beeby.

Though Dr Brocklesby conducted his affairs with a prudent economy, equally removed from meanness and profusion, yet he was distinguished by that true benevolence and liberality of disposition, which is ever desirous to possess the means, as well as the inclination, to do good. There is a species of generosity, spring-

* It has been stated by one of his biographers, that Dr Brocklesby received pensions from five noble families besides the Duke of Richmond's; but, whatever may have been his authority, the statement is not correct.

ing no doubt from the noblest motives, which wastes itself in a few unavailing efforts; but that practical benevolence which is alone worthy of our praise and imitation, seems to have been possessed, in a very high degree, by Dr Brocklesby. The frugality which is dictated by selfish feelings, is one of the meanest failings with which the human character can be stained; but the economy which husbands the resources of charity, and directs them with caution to proper objects, is a virtue beyond all praise.

No sooner was Dr Brocklesby informed that Dr Johnson was prevented, by the narrowness of his income, from going to the Continent for the recovery of his health, than he offered him, in the most delicate manner, an annuity of 100*l.* during the remainder of his life. When the Doctor declined this offer, his generous friend pressed him to reside in his house, as more suited to his health than that in which he then lived. His conduct to Edmund Burke was equally noble and generous. Dr Brocklesby transmitted to him 1000*l.*, with the notification, that he intended to leave him this sum at his death, but that he thought it might be of more use to him at present.

At one period of his life, Dr Brocklesby was an enthusiast in politics, and participated in the early proceedings of the Whig Club; but he afterwards abandoned the leaders of that party, along with Mr Burke and the Duke of Richmond.

Dr Brocklesby was, at one time, induced to accept a challenge, which originated in some professional jealousies. The Doctor having spoken openly against some improper means which he supposed had been employed by Sir John Elliot, in order to procure the favour of a family on which they had jointly attended; the friends of Sir John incited him to send a challenge to Dr Brocklesby. The parties met in the field to determine this point of honour; but they were luckily separated after the first fire, by a centinel on guard.*

In addition to the works which we have already mentioned, Dr Brocklesby published, in 1760, his *Oratio Harveiana*, which he pronounced before the Royal College of Physicians. In the Transactions of the Royal Society for 1747, vol. xlv., he published a letter "On the Indian Poison sent over by Don Antonio de Ulloa." In the Transactions for 1747-8, vol. xlv., he published a paper "On the poisonous root lately found mixed among the Gentian;" and, in the same work for 1755, vol. xlix., appeared, his *Experiments on the Sensibility and Irritability of the several parts of Animals*. In the third and fourth volumes of the *Medical Observations*, he published the case of a lady labouring under diabetes; experiments relative to the analysis of Seltzer water; and a case of an encysted tumour in the orbit of the eye. Dr Brocklesby wrote also a *Dissertation on the Music of the Ancients*, which was published in 1749. (s)

BROEK, a town, or large village, in North Holland, celebrated for the elegance and cleanness of the houses and streets. The houses are built of wood, and roofed with tiles. The brilliancy of the colours with which the outside of them is painted, the beautiful gardens before them, adorned with shell-work and statues, and the unusual care which is taken by the inhabitants to keep the streets clean, render this village an interesting object of curiosity. Little rivulets pass by the sides of the houses; and the streets are made so narrow, for

the purpose of being kept clean, that they do not admit carriages, and cattle are not allowed to pass through them. The streets are paved with bricks, which are washed and smoothed with a polisher, and they are covered with sand, on which is drawn a variety of figures. The inhabitants do not permit an inn to be established in the town. At the entrance to several of the houses there are pairs of slippers, ready for the use of those whose shoes are soiled with mud. The town is principally inhabited by merchants, who have retired from business, or who have a connection with some of the commercial houses in Amsterdam. This town formerly carried on a considerable commerce with the Baltic, with Dantzic, and Königsberg; but it has now greatly diminished, and the only articles of its trade are corn and cattle. (w)

BROKER, (*Broccator*, *Broccarius*, and *Auxionarius*), signifies, in general, one who is employed to make and conclude bargains between merchants and tradesmen, in matters of money and merchandize, for a fee or reward. The word is derived from a *broken* trader, and that from the Saxon *broc*, signifying misfortune; so that *broker* denoted one who was a broken trader by misfortune; and formerly, it is said, none but persons falling under this description were allowed to exercise the employment of a broker.

There are *Exchange-brokers*, *Insurance-brokers*, *Stock brokers*, and *Pawn-brokers*.

Exchange brokers, are those whose business it is to understand the alteration of the course of exchange, to inform merchants how it goes, and to notify to those having money to pay or receive abroad, who are proper persons to negotiate the exchange with. When the business is concluded, they have an allowance for brokerage, amounting to two shillings for every 100*l.* sterling. See EXCHANGE.

By the statutes 8 and 9 W. III. c. 20, and 6 Ann. c. 16, exchange brokers are to be licensed in London, by the lord mayor and aldermen, who administer to them an oath, and take bond for the faithful execution of their offices. Persons acting as brokers, without being thus regularly licensed and admitted, are liable in a forfeiture of 500*l.*; and those who employ them forfeit 50*l.* The same is the case at Bristol, by statute 3d Geo. II. c. 51. Brokers must register contracts, &c. under the like penalty; and they are not allowed to deal for themselves, on pain of forfeiting 200*l.* They are also appointed to carry about with them a silver medal, bearing the king's arms, and the arms of the city, &c. and to pay 40 shillings yearly to the chamber of the city.

Insurance brokers, are agents who transact the business of insurance between the merchant or party insured, and the underwriters or insurers. (See INSURANCE.) This being an employment of great trust, insurance-brokers ought to be, and indeed generally are, persons of respectability and honour, in whom unlimited confidence can be reposed.

It is generally understood, although the point has never been settled by any judicial decision, that, by the usage of trade in London, the underwriters give credit only to the broker for their premiums, and can resort only to him for payment: and that, on the other hand, he alone, and not the underwriters, can recover the premiums from the insured. An open account is therefore usually kept between the broker and every underwriter with whom he has much dealing, in which the broker

* It is not true that they were attended by seconds, who placed them at a secure distance from each other.

makes himself debtor to the underwriter for all premiums, and takes credit for all losses to which the underwriter is liable, and which the broker is authorised to receive. Such losses, however, are not to be regarded as a debt from the underwriter to the broker.

In the case of the bankruptcy of a policy broker, the court of King's Bench (23d George III.) held, that though credit for the premiums must be given to the broker, because the underwriters know nothing of the principals; yet that they could not set off the losses, or returns of premium due to the principals, and which they only could sue for, against a debt due from the defendants to the bankrupt. In this case, it may be observed, the defendants had no commission *del credere*. In a subsequent case, where the action was brought by the assignees of an underwriter against the factor, it was determined (26th George III.) that the defendant might set off losses upon policies subscribed by the bankrupt, and due to the defendant's correspondents; but there the defendant had a commission *del credere*; which, Lord Mansfield said, made him liable to his correspondents for losses, without first bringing an action on the policy against the underwriter.

The various duties and obligations incumbent on those exercising the office of an agent or broker, are similar to those which exist, in general, in cases of express or implied undertaking, and are treated of at large in the different works on insurance. See *Marshall on Insurance*, vol. i.; also the articles *INSURANCE* and *POLICY*.

Stock brokers, are persons employed to buy and sell shares of the joint stock of any company or corporation, or in the public funds. The business of these brokers is regulated by the statutes, 6th George I. c. 18., and 7th and 10th George II. c. 8. See *Stocks* and *Stock-Jobbing*.

Pawn brokers, called also *pawn takers*, *tally-men*, *frierers*, or *frierers*, are persons who keep shops, and lend out money to necessitous people, generally at an exorbitant rate of profit.

By stat. 25th George III. c. 48, pawn-brokers are required to take out an annual licence on a 10*l.* stamp, within the bills of mortality, and 5*l.* in any other part of the kingdom, for each shop kept, under a penalty of 50*l.* By 29th George III. cap. 57, confirmed by 31st George III. c. 52., and 53d George III. c. 53., the following rates of profit are allowed to pawn-brokers for interest and warehouse-room: For every pledge upon which there has not been lent above 2*s.* 6*d.*, one half-penny per month; for 5*s.* one penny; for 7*s.* 6*d.* one penny half-penny; for 10*s.* two-pence; and so on progressively, at a proportional rate, for any sum not exceeding 40*s.*; and for any sum exceeding 40*s.* and not exceeding 10*l.*, at the rate of 3*d.* per 20*s.*, and so in proportion for any fractional sum. A party may redeem pawned goods within seven days after the expiration of any month, without paying any thing for the seven days; after seven and within sixteen days, he pays interest for one month and a half; but after the first fourteen days, the pawn-broker may take for the whole month.

The pawn-broker is required to make entries and give duplicates. If he refuses to deliver up goods pledged within one year, on tender of the money lent and interest, a justice is empowered, on conviction, to commit him till the goods be delivered up, or reasonable satisfaction be obtained. After the expiration of one year, pawned goods may be sold by public auction; being exposed to public view, and catalogues of them published,

and two advertisements of sale inserted in some newspaper, at least two days before the first day's sale, under a penalty of 5*l.* to the owner. If pawn brokers receive notice from the owners before the expiration of a year, they are not allowed to dispose of the goods until three months shall have expired from the end of that year. They must enter in their books an account of sales of all goods pawned for more than 10*s.*; and, in case of sale, the overplus to be paid upon demand, within three years, to the owner, deducting interest and costs, under a penalty, upon refusal, of treble the sum lent, to be levied by distress.

Pawn-brokers are not allowed to purchase goods in their custody, or suffer them to be redeemed for that purpose. They are not to lend money to any person appearing to be under the age of twelve years, or intoxicated; nor to purchase duplicates of other pawn-brokers; nor to buy any goods before eight in the morning, and after seven in the afternoon; nor to receive any goods in pawn before eight in the morning, or after nine at night, between Michaelmas and Lady-day; nor before seven in the morning, or after ten at night, during the remainder of the year, excepting the evenings of Saturday, and those preceding Good Friday and Christmas day. They are not to carry on the trade on any Sunday, Good Friday, or Christmas day. Pawn-brokers offending against the act, in cases where no penalty is provided, shall forfeit 5*l.* for every offence; and, in all cases, complaint must be made within twelve months. But the act does not extend to pledges for money above 10*l.*, nor to persons lending money upon goods at 5 *per cent.*

Any person who shall fraudulently pawn the goods of another, shall, upon conviction before a justice, forfeit 20*s.* and the value of the goods so pawned; and, failing to pay, shall be committed to the house of correction for not more than three months, nor less than one. Persons counterfeiting or altering duplicates, may be committed by a justice to the house of correction for a similar period. If any person shall offer to pawn goods, refusing to give a satisfactory account of himself and them; or if there be reason to suspect that the goods are stolen; or if any person, not entitled, shall attempt to redeem pawned goods, they may be taken before a justice for examination; who, if there appear cause, may commit the offender, to be dealt with according to law, provided the nature of the offence shall authorise such commitment by any other law; or otherwise, for a period not exceeding three months, nor less than one. A justice may also grant a search-warrant, and a peace-officer break open doors, and restore the goods, if found, to the owners. (z)

BROMELIA, a genus of plants of the class Hexandria, and order Monogynia. See *BOTANY*, p. 176, and *PINE APPLE*.

BROMLEY, a market town of England, in the county of Kent, is situated on the river Revesbourn, 10 miles south-east from London. It is a clean, well-built, straggling town, but containing nothing worthy of notice, except the hospital erected by Dr Warner, Bishop of Rochester, in the reign of Charles II., for twenty poor clergymen's widows. It was the first endowment of the kind in England, and has been considerably augmented by several additional charitable bequests. In 1756, Mrs Betenson of Bradbourne left 10,000*l.*, for the purpose of erecting ten additional houses; and since that time, Mr Pearce has bequeathed 12,000*l.* for a similar purpose. So that by these means the number of houses is now

doubled, and the annual allowance to each of the widows on Bishop Warner's foundation is 30*l.* 10*s.* with coal and candle; and 20*l.* to each of the others; with a salary of 86*l.* to the chaplain, who must belong to Magdalen College, Oxford. The church of Bromley is a spacious edifice, consisting of a nave, chancel, and aisles; with an embattled tower at the west end, surmounted by a cupola. Its north aisle was rebuilt in 1792, to the expence of which Bishop Thomas contributed 500*l.* Bromley has also a charity school, for educating and clothing thirteen boys and as many girls. Its market-house is a large old building, standing on wooden pillars; and its fairs are on the 14th of February and the 5th of August.

Near the town is the palace of the Bishop of Rochester, which was first erected in 700, in consequence of his having received the manor of Bromley as a gift from King Edgar; and it has continued to be the residence of the bishops of that see till the present time. The old building was pulled down by the late Bishop, and a plain brick mansion erected in its stead about the year 1777. In the vicinity is a spring, which is said to possess the same qualities as the water of Tunbridge wells, and which was much frequented in monkish times, and held in high estimation. Bromley contains 424 houses, and 2700 inhabitants. See Wilson's *History of Bromley*, and *Beauties of England and Wales*, vol. viii. p. 1353. (L)

BROMSGROVE, a market town of England, in the county of Worcester, is situated near the source of the river Salwarp, 12 miles from Worcester, and 116 north-west from London. It is rather irregularly built, but has a very handsome church, with windows of painted glass, and a tower and spire, which are the neatest in the county. The church stands upon an eminence, and is approached by a flight of 50 steps; and contains several fine monuments, among which are those of Judge Lyttleton, Bishop Hall of Bristol, Sir Humphrey Stafford, Sir John Talbot, and a daughter of Henry VII. It has a good grammar school, founded by Edward VI. for educating and clothing twelve boys, which has been additionally endowed by Sir Thomas Cooks; and also several alms-houses. Bromsgrove has some flourishing manufactures of woollen and linen cloths, nails, needles, and other hardware. It is governed by a bailiff, recorder, and aldermen, and a court baron is held in the town-hall, by the lord of the manor, every three weeks, for the recovery of debts under 40*s.* In 1801, this town contained 1178 houses, and 5898 inhabitants, of whom 1208 were returned as employed in trade and manufactures. It has two annual fairs for linen cloth, cheese, and horses, and a weekly market on Thursday.

In the neighbourhood, are Grafton manor, the ancient residence of the earl of Shrewsbury; Dodford priory; and Hewell-Grange, the seat of the earl of Plymouth. See Nash's *History of Worcestershire*. (h)

BROMUS, a genus of plants of the class Triandria, and order Digynia. See BOTANY, p. 100.

BRONCHOCELE. See SURGERY.

BRONZE, the name of a mixed metal, which the ancients employed for casting statues and other ornaments. According to Vasari, the bronze of the Egyptians consisted of two-thirds of brass, and one of copper; and Pliny informs us, that the Greeks added to the brass one-tenth part of lead, and one-twentieth part of silver.

In casting bronze figures, particular attention must

be paid to the formation of the mould. The pattern from which the cast is to be made must have a mould made upon it, with a mixture of one-third of plaster of Paris, and two-thirds of brick-dust. Its thickness should be proportioned to the weight of the figure; and small air-holes, opening upwards, should be made in the joints, to give free passage to the air, which is thrust out by the entrance of the metal. Over the interior surface of the mould there should be spread neatly a layer of clay of the intended thickness of the metal. When this is done, the concavity, which is bounded by the layer of clay, is to be filled with the composition of plaster of Paris and brick-dust already mentioned, which will form the core. When the figure is long, strong bars of iron must be laid in the mould as a support to the metal figure, and round these the core must be cast. The mould is then opened, the layer of clay taken, and every kind of dampness expelled, by drying the mould and core with charcoal or lighted straw. The core is then replaced in the mould, where it is supported in its proper position by short bars of bronze, which run through the mould into the core. The mould being strongly fortified with iron bars, and fixed in a right position, the liquid bronze is poured into the mouth of the mould. (π)

BRONZING, is the art of imitating bronze, or of communicating to figures in wood, ivory, plaster, &c. that greenish rust which distinguishes the bronze figures of the ancients. The golden bronze is made of the finest and brightest copper dust, and when it is wanted of a red colour, a small quantity of red ochre, well pulverised, is added. They are both put on with varnish, and the body to which they are applied is immediately dried over a chafing dish, to prevent it from turning green.

The following method of bronzing figures is extremely simple. After having covered the figure with a coat of gum water, mixed with a little minium, take a little fish glue, dissolved in spirits of wine, by exposing them in a warm place, and add to it some saffron; then take the filings or dust of any metal which it is wanted to imitate, and apply this, when mixed with the glue, to the figure, with a hair pencil.

In bronzing copper, the Chinese first rub it with vinegar and ashes, till it is well polished. When the copper is well dried in the sun, they cover it with a coat, made in the following manner. Take two parts of verdigris, two parts of cinnabar, five parts of sal ammoniac, two parts of the bill and liver of ducks, five parts of alum; pound and mix them well, and form them into a clear paste. The copper, after being covered with a coat of this paste, is dried, cooled, and washed, and the same operation is repeated about ten times.

Iron may be bronzed merely by rubbing it when hot with the hoof of a cow, and with oil. For farther information on this subject, see a Paper by Macquer, in the *Memoirs of the French Academy for 1767*; Birch's *History of the Royal Society*, vol. i. p. 103; and *Supplement de l'Encyclopedie*, tom. ii. p. 72. (π)

BROOKE, HENRY, an ingenious author, though of eccentric and irregular talents, was born in Ireland, in the year 1706. In the earlier period of his life, he became a pupil of the celebrated Dr Sheridan, and afterwards prosecuted his studies at Dublin college, whence he removed to the Temple.

Having returned to Ireland, he there privately mar-

ried his cousin, an amiable young woman, to whom he had been appointed guardian. With her he lived, for some time, in domestic retirement, until the increase of his family compelled him to have recourse to his literary talents, in order to make his income adequate to their maintenance. With this view he repaired to London, and, in 1735, wrote his philosophical poem, entitled, *Universal Beauty*. Thereafter, he again returned to his native country, and engaged in the practice of the law; but his inclination carrying him to literary pursuits, he revisited the metropolis, and offered his tragedy of *Gustavus Vasa* to the stage. The strong sentiments of liberty with which this play abounded, excited the attention of government, and its public representation at the theatres was authoritatively prohibited. But the author was more than indemnified for any pecuniary loss which he might have suffered, in consequence of this proceeding. His private friends, and the political party attached to Frederick, Prince of Wales, encouraged him to publish the play by subscription, in 1739; and this measure succeeded so well, that Brooke derived from it more emolument than he probably would have done, had the piece been exhibited on the stage. Finding his expences, however, still too great, when compared with his limited income, he was reduced to the necessity of quitting the house he had taken at Twickenham, dismissing his servants, and again retiring to his native country.

In 1745, he produced his tragedy, entitled, *The Earl of Westmoreland*, which was represented on the Dublin theatre; and, in the same year, he published his *Farmer's Letters*. About this time, too, he obtained the appointment of barrack-master from the Earl of Cheshire, then lord-lieutenant of Ireland. In 1747, he contributed three pieces to Moore's *Fables for the Female Sex*, of which *The Female Seducers* has been peculiarly admired. His tragedy of *The Earl of Essex* was acted at Dublin in 1749, and at Drury-lane in 1760. It does not appear certain whether any of his other dramatic pieces were ever publicly performed at any theatre.

Brooke now lived in rural retirement, having united his family with that of an only brother; both residing together in the most perfect harmony. His mind, which had always been strongly impressed with devotional feelings, became, at length, a prey to the gloomy and withering influence of methodism, which gradually depressed his spirits, and deranged his intellects. The embarrassed state of his pecuniary circumstances, combined with the loss of his wife, after a happy and affectionate union of nearly 50 years, and the death of a favourite child, must have contributed, in no slight degree, to promote his disposition to melancholy and depression. In 1762, he published a treatise, entitled, *The Trial of the Roman Catholics*; and, in 1766, his novel, *The Fool of Quality*,—a work which attracted considerable attention, and of which the last volumes displayed the prevailing bias of the author's mind. The decay of his faculties, however, was still more sensibly indicated by his *Juliet Grenville*, a novel which he published in 1774. He died in the month of October 1783. His works, exclusive of the novels, were printed together in four volumes octavo, 1780, but are now little read. See the life of the author prefixed to his works. (z)

BROOKLYN, Battle of. See vol. I. p. 636.

BROOME, WILLIAM, an English poet, was born in

Cheshire, of poor parents; and after being educated upon the foundation at Eton, was, by the contribution of his friends, sent to St John's college Cambridge, where he obtained a small exhibition. During his education in that university, he was so fond of writing verses, that, among his companions, he was known by the name of Poet, although his juvenile pieces by no means entitled him to that appellation. He next appeared as a translator of Homer into prose, in conjunction with Ozell and Oldisworth; but that work has long ago fallen into oblivion.

It, however, paved the way for his introduction to Pope, who employed him to make extracts from Eustathius, for the notes to the translation of the Iliad; and in the volumes of poetry published by Lintot, commonly called "Pope's Miscellanies," many of his early pieces are inserted. Pope afterwards employed him, in conjunction with Fenton, in translating the Odyssey, and assigned him the 2d, 6th, 8th, 11th, 12th, 16th, 18th, and 23d books of that poem; together with the task of writing all the notes. For the four books translated by Fenton, Pope paid 300*l.*; while Broome received no more for the whole of his part of the work than 600*l.* This scanty payment produced a quarrel betwixt him and his employer, which ended in a complete breach of their friendship. Broome charged Pope with an avaricious spirit; and Pope, in revenge, gave him a place in the *Dunciad*; quoted him in the *Bathos* as a proficient "in the art of sinking;" and compared him to a "parrot, who repeats another's words in such a hoarse old tone, as to make them seem his own."

He afterwards published a miscellany of poems; and, in the latter part of his life, amused himself with translating odes of Anacreon, which appeared in the *Gentleman's Magazine*, under the name of *Chester*. In the church, he never rose higher than a rector, and died at Bath in 1745.

"Of Broome," says Johnson, "though it cannot be said that he was a great poet, it would be unjust to deny that he was an excellent versifier: his lines are smooth and sonorous, and his diction is select and elegant. He had such power of words and numbers, as fitted him for translation; but, in his original works, recollection seems to have been his business more than invention. His imitations are so apparent, that it is part of his reader's employment to recal the verses of some former poet."

His assistance was deemed so necessary to Pope, in the translation of the Odyssey, that it gave occasion to this humorous distich:

"Pope came clean off with Homer; but they say
"Broome went before, and kindly swept the way."

Johnson's *Lives of the Poets*, vol. iii. (A. r.)

BROSELEY, a market town of England, in the county of Salop, is situated on the river Severn, which separates it from Madeley, 146 miles N. W. from London. It possesses considerable iron-works, where cannon and all kinds of cast-iron articles are founded; and also a manufactory for glazed tobacco-pipes. But it is chiefly remarkable for a curious burning spring in the neighbourhood, which was discovered in June 1711. It was first announced by a terrible noise in the night-time, which awaked several people that lived near it, who, going out to ascertain the cause, perceived, about 200 yards from the Severn, a surprising shaking of the earth, and a little boiling up of water through the grass.

Upon digging round the spring, the water sprung up to a great height, and a candle, which they held in their hand, set it on fire. This circumstance excited great curiosity; and many persons, from different parts of the country, came to visit the *burning well*. To prevent it from being destroyed, an iron cistern was placed upon it, with a small hole in the middle of the cover, through which the water might be viewed. When a lighted candle was put into this hole, the water immediately took fire, darting and flashing in a violent manner, much in the same way as spirits in a lamp, but with greater agitation. Its heat exceeded that of any other combustible matter. It would sometimes burn for 48 hours together, without any sensible diminution; and an ordinary tea-kettle, full of water, by being placed upon the hole, was made to boil in nine minutes. In 1747, it had been lost for many years; and the poor man in whose land it was, missing the profit which it brought him by shewing it to strangers, applied his utmost endeavours to recover it; and, after many fruitless attempts, he happened to hit upon it, about 30 yards nearer the river, by attending to a rumbling noise under ground, similar to that by which it was first discovered. It, however, completely disappeared in 1755, by the sinking of a coal-pit in the neighbourhood. Some have attempted to account for this phenomenon, by supposing the water to have been mixed with *petroleum*, one of the most inflammable substances in nature, and which has the property of burning in water; and others, that the vapour produced by the fermentation of coal and iron-ore, which abound in the vicinity, by ascending with violence through the chinks of the earth, gave the water its turbulent motion and inflammable quality.

Broseley is chiefly inhabited by colliers and miners, and carries on a considerable trade in coals with the different towns upon the Severn. Houses, 1022; population, 4832. See *Philosophical Trans.* for 1712, vol. xxviii. p. 475; and for 1747, vol. xlv. p. 370; also Penant's *Tour*. (L)

BROWNE, SIMON, a dissenting minister in England, was born in Somersetshire about the year 1680. Endowed with superior powers of mind, which he had cultivated by early and assiduous study, he was found qualified for the ministry before he had attained the twentieth year of his age; and was elected minister of a numerous and respectable body of dissenters in Portsmouth, among whom he discharged the duties of his office with fidelity and diligence for several years. Having been called to the pastoral charge of a congregation of dissenters in London, he left Portsmouth in 1716, with the universal regret of his hearers. There he officiated for about seven years, with much credit to himself, and satisfaction to his people; till, in 1723, his mind sustained a severe shock by the death of his wife and an only son, and his grief at last settled in a deep and incurable melancholy. His mental disorder was of a very

uncommon kind. In the beginning of it, he was completely miserable, and felt frequent and strong desires to deprive himself of life; but afterwards, his mind became more serene and composed, and, on some occasions, he would even assume a degree of cheerfulness and pleasantry; but he could never afterwards be prevailed upon to resume the duties of his pastoral office, nor even to join in any act of worship, either public or private. His own idea of his unhappy state is thus expressed in the *Adventurer*, No. lxxxviii. "He believed that the Almighty by a singular instance of divine power, had, in a gradual manner, annihilated in him the thinking substance, and utterly divested him of consciousness; that though he retained the human form, and the faculty of speaking in a manner that appeared to others rational, he had all the while no more notion of what he said than a parrot, and consequently no longer looked upon himself as a moral agent, or as a subject of reward or punishment." In that unhappy conviction he continued till the day of his death. Nothing gave him greater uneasiness than to find, that he could not persuade his friends that his state was really such as he believed it to be. This he accounted a charge against his veracity, which he endeavoured to repel by the strongest and most confident assertions. At other times, he viewed their incredulity as a part of that divine judgment by which he himself had been deprived of his mental existence; and believed that, by the all wise but unsearchable decree of heaven, he was placed beyond the reach of divine mercy. For that reason, he, for a long time, objected to any prayers being offered up by his friends in his behalf; but when his mind became more serene, he requested that they would pray for him, and was consoled by being recommended to the divine compassion.

But the most remarkable circumstance in his case, and which may be termed peculiar to it, was, that while he asserted that he had nothing more than a material existence, he gave undoubted proofs, both by his conversation and his writings, that his mental faculties existed in their full vigour. Having quitted the ministry, he retired to the place of his nativity in Somersetshire, where he translated several passages of the Greek and Latin poets into English verse; composed various small works for the use of children; and, with great labour, compiled a Dictionary of the Greek and Latin tongues, with a compendious list of the themes in both languages. None of these works, however, nor some others written at the same time, were ever published; but, during the last two years of his life, having devoted his time to religious study, he produced some excellent treatises in defence of Christianity: 1. "A Sober and Charitable Disquisition concerning the Importance of the Doctrine of the Trinity, particularly with regard to Worship, and the Doctrine of Satisfaction." 2. "A fit Rebuke to a ludicrous Infidel, in some Remarks on Woolston's Fifth Discourse on the Miracles of our Saviour, with a Preface, shewing the impropriety of prosecuting such Writers by the Civil Powers;"—a treatise, says Dr Leland, in his *View of the Deistical Writers*, written with great smartness and spirit. And, 3, "A Defence of the Religion of Nature, and of the Christian Religion, against the defective Account of the one, and the exceptions against the other, in a Book entitled *Christianity as old as the Creation*;"—which Leland styles "a good and solid answer to Tindal." These treatises were all published in 1732; and although, in composing

them, it is said he availed himself but little of assistance from books, or from literary conversation, yet they discover a great extent of knowledge, and a mind in its full vigour. To the last of these works he had prefixed a dedication to Queen Caroline, which his friends, from a belief that it would injure the publication, very prudently suppressed, but which, on account of its singularity, is worthy of being preserved.*

During his retirement in the country, he could not be prevailed upon to enjoy the benefit of free air and exercise; and his sedentary life, joined to his intense application to study, brought on a complication of disorders, which put a period to his existence at the close of the same year, 1732, while he was in the 52d year of his age.

His writings prove him to have been a good scholar, and an able divine; and, while he showed himself superior to the opposers of Christianity in argument, he was also a zealous advocate for civil and religious liberty. In private life, he appears to have been a man whose heart was highly susceptible of warm and steady friendship, and whose mind was filled with an ardent zeal for the interests of pure and practical religion. See *Biogr. Dict.* and *Biogr. Brit.* (A. F.)

BROWN, JOHN, (M. D.) a very extraordinary medical theorist, was born about the end of 1735, or the beginning of 1736, at the village of Lintlaws, or Preston, in the parish of Buncle, in Berwickshire. His father certainly moved in no higher rank than that of a day-labourer, and belonged to the class of dissenters known in Scotland by the name of Seceders,—a sect, at that time, remarkable for austerity of life and solemnity of demeanour. However contracted the notions of the elder Brown may have been on religious topics, he seemed to have been animated by a very laudable desire of communicating to his infant son all the information which his narrow finances could allow; and accordingly we find, that such attention had been paid to the improvement of the boy, as to have enabled him to read

the whole of the Old Testament before he had attained his fifth year. His progress in his native language induced his father to send him to the grammar-school of Dunse, which was then taught by Mr Cruickshank, a gentleman whose name is recollected with grateful affection by those whose opportunities best enabled them to appreciate his worth. Scarcely had our author commenced his classical career, when he sustained a severe loss in the death of his father. This event, however, did not retard his mental improvement, for he continued under Mr Cruickshank's care until he was between nine and ten years of age. By that time he had attained the highest rank in the school, which is distinguished in Scotland by the title of *Dux*.

This may be considered the period at which young Brown's misfortunes commenced. The limited funds of his parents could no longer support the expense of retaining him at school, and he was doomed to be a weaver. As might have been anticipated, he did not long remain in this truly mechanical employment; the exact period is not ascertained, but it is sufficiently known, that he owed his change of situation to the liberality and favour of his old teacher, who having offered to give him gratuitous instruction, induced his mother and his step-father to forego his original destination, and to look up for him to the dignity of a seceding preacher. His progress in his studies, on resuming them, justified the high opinion which Mr Cruickshank had formed. He soon regained his lost ground; and, in the absence of the master, always presided and maintained order. It is probable that, between his twelfth and thirteenth year, the occurrence took place, which, in some measure, determined his future fate. He had been educated in all the severity of puritanism; but having on one occasion been tempted to "hear a sermon in the established church of Dunse," he was summoned to appear before a meeting of the seceding congregation; where he had every reason to expect a very severe censure: this his proud spirit could not easily brook, he

* Dedication to Queen Caroline.—"Madam,—Of all the extraordinary things that have been tendered to your royal hands since your first happy arrival in Britain, it may be boldly said, what now bespeaks your majesty's acceptance is the chief. Not in itself indeed it is a trifle unworthy your exalted rank, and what will hardly prove an entertaining amusement to one of your majesty's deep penetration, exact judgment and fine taste. But on account of the author, who is the first being of the kind, and yet without a name.

"He was once a man, and of some little name: but of no worth, as his present unparalleled case makes but too manifest; for by the immediate hand of an avenging God, his very thinking substance has for more than seven years been continually wasting away, till it has wholly perished out of him, if it be not utterly come to nothing. None, no not the least remembrance, of its very ruins remains; not the shadow of an idea is left, nor any sense that so much as one single one, perfect or imperfect, whole or diminished, ever did appear to a mind within him, or was perceived by it.

"Such a present from such a thing, however worthless in itself, may not be wholly unacceptable to your majesty, the author being such as history cannot parallel: and if the fact, which is real and no fiction, nor wrong conceit, obtains credit, it must be recorded as the most memorable, and indeed astonishing event in the reign of George II., that a tract composed by such a thing, was presented to the illustrious Caroline; his royal consort needs not be added; fame, if I am not misinformed, will tell that with pleasure to all succeeding times.

"He has been informed that your majesty's piety is as genuine and eminent, as your excellent qualities are great and conspicuous. This can indeed be truly known to the great Searcher of Hearts only. He alone, who can look into them, can discern if they are sincere, and if the main intention corresponds with the appearance: and your majesty cannot take it amiss, if such an author hints, that his secret approbation is of infinitely greater value than the commendation of men, who may be easily mistaken, and are too apt to flatter their superiors.

"But if he has been told the truth, such a case as his will certainly strike your majesty with astonishment, and may raise that commiseration in your royal breast, which he has in vain endeavoured to excite in those of his friends; who, by the most unreasonable and ill-founded conceit in the world, have imagined, that a thinking being could for seven years together live a stranger to his own powers, exercises, operations, and state; and to what the great God has been doing in it, and to it.

"If your majesty, in your most retired address to the King of kings, should think of so singular a case, you may perhaps make it your devout request, that the reign of your beloved sovereign and consort may be renowned to all posterity, by the recovery of a soul now in the utmost ruin; the restoration of one utterly lost at present amongst men.

"And should this case affect your royal breast, you will recommend it to the piety and prayers of all the truly devout, who have the honour of being known to your majesty; many such doubtless there are, though courts are not usually the places where the devout resort, or where devotion reigns. And it is not improbable, that multitudes of the pious throughout the land, may take a case to heart, that, under your majesty's patronage, comes thus recommended.

"Could such a favour as this restoration be obtained from Heaven by the prayers of your majesty, with what transports of gratitude would the recovered being throw himself at your majesty's feet: and, adoring the divine power and grace, profess himself, madam, your majesty's most obliged and dutiful servant, SIMON BROWN."

immediately renounced his sect, and declared himself a member of the established church—an event which the seceding church may regret as long as it exists.

With his change of doctrine, a corresponding change in his hitherto habitual gloominess of manners took place; and some have asserted, that that freedom, with regard to religious concerns, which he afterwards strongly displayed, became very perceptible even at this period; indeed, the effect is what will be very generally produced on persons possessed of vivid but ill regulated feelings.

About his thirteenth year, his proficiency in literature was so considerable, as to induce Mr Cruickshank to appoint him usher to his school, in which situation he remained between five and six years. During this time he devoted himself to the duties of his employment, and to his improvement in Grecian and Roman literature. It may be here remarked, that he distinguished himself among his companions, not only by his superiority in his studies, but also by his skill in almost every athletic exercise—wrestling, boxing, and running, were his favourite recreations.

On quitting the situation of usher to Mr Cruickshank, he went into the family of a neighbouring gentleman, as tutor to the children. There he did not long remain; but whether his removal was owing to the insolence of the gentleman with whom he lived, or to his adding "the stiffness of pedantry to the sourness of bigotry," is a point at issue among his biographers: we strongly suspect that each of these causes may have had some effect, though bigotry probably had the least.

On leaving the family of which he had so recently become an inmate, he proceeded to Edinburgh, and attended the philosophical classes with success; he afterwards made some progress in his theological studies; but his attention was soon diverted from the latter to medical speculations, by his having accidentally translated a thesis, or inaugural dissertation, into Latin, which at once exceeded the expectations of his employer, and gave a new impulse to his genius.

Having resolved on altering the course of his life, he returned to Dunse and resumed his labours as usher—the duties of this humble though important office, he performed from Martinmas 1758 to the same term in 1759. He then returned to Edinburgh, and a vacancy having occurred in the High School of that city, he became a candidate to fill it; but being destitute of a patron, he failed, as usual in all similar cases, and was left to struggle against adversity, with the embarrassments that appear almost incidental to talent.

Though disappointed, he did not despair, but applied with vigour to his medical pursuits; and, as a preliminary step, addressed a Latin letter (which is said to be pure and elegant) to the late venerable and acute Dr Monro, stating his necessities, and requesting the privilege of free admission into the Anatomical Theatre: So successful was this first application, that he was encouraged to address the remainder of the Professors of the University of Edinburgh;—it need scarcely be added, that their liberality equalled his highest expectations. We feel proud in thus recording an event, which we are also proud to add, has many parallels at the present time.

Thus encouraged by the favour of his teachers, John Brown entered on his medical career, and prosecuted it with an ardour that was amply recompensed by his success. During his labours for two or three years, he

supported himself by teaching the classics; but afterwards finding himself qualified to promote the studies of the more advanced students, he abandoned his early occupation, and engaged in that profession which is technically phrased among the young men of the university "*grinding*." As this is a profession little known beyond the precincts of the college of James the Sixth, it may be proper to give some account of its origin and history. It is well known, that among the multitude of young men who crowd to Edinburgh to receive medical instruction, there is a very abundant proportion whose literary attainments are remarkably humble; many of these young men, on being initiated into societies, and on learning that they can talk as well as wiser men, aspire to the highest dignity of the science. Not being possessed of Latin enough, either to write the inaugural dissertation, or to undergo the various examinations to which every candidate must be subjected, it becomes necessary to employ some one qualified to execute the first, and to afford such rapid instruction as may enable them to overcome the mighty difficulties which oppose their progress. Some young man, fitted by talent and experience to exercise this calling, engages in it, and is called a "*grinder*." A name particularly expressive, when we consider its origin. It is but justice to add, that these grinding performers are sometimes employed by men of education and talent, who are indolent, and wish speedily to be familiarized with colloquial Latin.

Previous to Mr Brown's engaging in this new profession, we have mentioned that he acted as a private teacher; and in that capacity he attended the family of the late Dr Cullen, who continued his patronage for as long a time as circumstances permitted. In 1761, Mr Brown became member of the Royal Medical Society of Edinburgh,—a society which can boast of having been upheld by the voluntary support of the students for upwards of seventy years, and of having enrolled the most distinguished medical philosophers among its members during that period.

Under the distinguished patronage of Cullen, Brown opened a boarding-house for the students of the university; the profits of which, with those of his profession, enabled him to marry. About this time he had the privilege of illustrating, every evening, the morning lecture of Dr Cullen, and for this purpose he was entrusted with the manuscript. But in spite of all these advantages, Mr Brown's total want of economy, and of attention to those matters which claim the notice of every honest man, soon involved him in pecuniary difficulties, from which he never appears to have been ever after freed. A compromise with his creditors at this time relieved his most urgent necessities.

After these unfortunate events, he laboured very hard, in hopes of obtaining a professorship in one of the infant seminaries of North America, then belonging to Great Britain; but this expectation was disappointed. He subsequently ascribed his want of success to selfish motives on the part of Dr Cullen: but it does not appear to have been a well-founded suspicion. Soon afterwards, he was farther disappointed in his views towards the chair of the Theory of Medicine, to which the present Dr Gregory was then elected. This event, which he also ascribed to the unfair conduct of his old patron, was followed by his rejection, on applying to become a member of the society which published the Edinburgh Medical Essays; which completed the breach between the professor and his quondam friend. Without better

information than can be easily obtained at present, we cannot pretend to decide how far Brown's allegations may be founded in truth, or if Dr Cullen had not some cogent reasons for having withheld his support on the occasions stated. It is not improbable that the irregularities of the former might have had their share in determining Dr Cullen's conduct, even if we adopt the very partial statement made by Brown's advocates. The whole of Mr Brown's speculations with respect to professorships having failed, he applied most diligently to *grinding*, and employed the manuscript of his "*Elementa Medicinæ*," as his text-book. His most sanguine expectations were exceeded by the progress which his opinions made among the students. Nor is it at all wonderful, when we consider the materials which compose the great body of medical students in the university of Edinburgh.

In the autumn of 1779, Brown took the degree of Doctor of Medicine at the University of St Andrew's, dreading lest his rupture with the professors of Edinburgh would thwart his wishes, had he attempted to realise them there. St Andrew's is celebrated for conferring degrees without residence, or even previous study, if the candidate be recommended by two physicians known to the university.

About this period, the contest between his partizans and those of his opponents, were carried to the highest possible pitch. The zeal of one party to convert, and the distaste of the other to be converted, produced all the effects consequent on such extreme absurdity. No man possessed of common understanding, would quarrel with another for differing with him on medical topics. But, strange to relate, many duels were fought to determine whether opium was a stimulant or a sedative.

Probably about this time Dr Brown discovered, that the medical practitioner, who devotes himself to the useful though unambitious pursuit of his profession, must anticipate no higher reward than the ephemeral applause which success, even in the hands of a block-head, cannot fail to procure; while those who venture into the dangerous regions of medical speculation and controversy, may not only enjoy all the advantages that result to their less ambitious brethren, but have the further satisfaction of being regarded as the founders of systems equally vague, hypothetical, and untrue, as those of their predecessors. The foregoing conjecture is in some measure confirmed by the publication of the first edition of the "*Elementa Medicinæ*," in 1780.

The next five years do not appear to have been occupied by any remarkable event. In 1785, the Doctor instituted the masonic lodge of the Roman Eagle. His views have been variously stated; but it is scarcely fair to seek for motives, when we have some of considerable weight assigned in the obligation signed by all the members of this institution. During this period, as well as every other, Dr Brown's inattention to his concerns involved him in continued difficulties; and once, it is recorded by one willing to palliate every error, he was reduced to the necessity of concluding a course of lectures in prison, to which his imprudence had carried him. Borne down by this continued train of misfortune and misery, he left Edinburgh with a wife and eight children for London, there hoping to retrieve his lost opportunities of comfort. Soon after his arrival in the metropolis, he delivered three successive courses of lectures at the Devil's Tavern; but being scantily attended, his profits were small. He also received a small

sum from Johnson, of St Paul's Church-yard, for the translation of his "*Elementa Medicinæ*."

It seems that a paltry intrigue disappointed him with regard to a situation offered to him by the Great King of Prussia; and a still more paltry revenge cast him into the King's Bench prison. By some means, too, it is said, that on a former occasion he lost the appointment to the Professorship of Medicine in the University of Padua.

During this unfortunate man's confinement in the King's Bench, he was solicited, by an eminent London bookseller and four associates, to contrive some nostrum, for which his name would secure an extensive sale. The coadjutors never making any specific proposal as to the quantum of reward to be received by the Doctor, the business was dropped. It is said that their intention was as knavish as it was illiberal. Availing themselves of Brown's necessities, they intended to increase his difficulties so much as to render any sacrifice acceptable. Then the nostrum might be had on easy terms. The liberality of two gentlemen, Mr Miller, and Mr Maddison of Charing-cross, averted this overhanging calamity; and, in the course of the year 1788, Dr Brown was restored to his family, in Golden-square. There he commenced a new set of speculations. He published a translation of his *Elementa Medicinæ*; he proposed a new edition of his *Observations*; a *Treatise on the Gout*, and on the *Operation of Opium on the Human Constitution*; a new edition of the *Elementa*, with additions; *A Review of Medical Reviewers*,—as the labours of the first year:—and, as those of the second, a volume of notes and illustrations of the *Elementa*; a second volume of *Observations*; and as much practice as he could get. In the midst of these anticipations of industry and of success, a stroke of apoplexy put an end to his life on the 7th October 1788, in the fifty-third year of his life.

That Brown was a very extraordinary man, cannot be doubted. His early acquirement of knowledge; his unwearied diligence, and acuteness of reasoning, point him out as a man fitted for a high sphere;—but his irritability, his intemperance, his want of religion, and of a due attention to the claims of his rising family, lessen the respect which his talents create. His faults appear in spite of the veil which affection has attempted to draw over them. None of his errors are more striking than his total want of prudence: his fate proves, very decidedly, the truth of Johnson's celebrated observation, "that nothing can supply the want of prudence; and that negligence and irregularity, long continued, will make knowledge useless, wit ridiculous, and genius contemptible."

Dr Brown's style has been often the subject of debate among his admirers and opponents. It appears to us often perplexed, sometimes vigorous, but coarse: his arguments are ingenious, and acutely managed; but the dogmatism with which he decides questions that can only admit of probable reasoning, disgusts even those who may be disposed to be pleased. His classical acquirements were very great; but he seems to have studied the more perplexed authors as his models in composition,—a circumstance which has tended not a little to lessen the number of his admirers, particularly since it has been urged, with more vehemence than truth, that this obscurity is consistent with the purest models extant. Cicero, however, is no less remarkable for purity of style, than for perspicuity and simplicity.

Upon the whole, we are disposed to think, that the panegyrista of our author have too highly extolled, and

his opponents have too much vilified, his works; for although they undoubtedly do not promise that benefit to mankind which the former have anticipated, yet they have not produced such evil effects as were produced by the latter. On the contrary, they have introduced somewhat more precision than formerly existed, into our medical reasonings, and have drawn the attention of physicians to many of those whimsical hypotheses which, under the sanction of illustrious names, had been generally admitted, from a want of examination.

Dr Brown's acknowledged works, are, his *Observations*, the *Elementa Medicina*, and the Translation of the latter. His acknowledged works, including inaugural dissertations, and various tracts, are said to be very numerous.

We shall conclude this article with a brief sketch of the leading features of his doctrines, as given in the two works above-mentioned.

The Brunonian Hypothesis may be reduced to the following principles—the application of which to every individual case, would exceed the limits of the present article.

1. Life, both of animals and vegetables, is constituted by three states, health, disease, and predisposition.

2. In each of these three states, animated beings are liable to be affected by certain external, or by certain internal causes, which produce the proper functions. These different agents are, 1st, Heat, food, wine, poisons, contagions, the blood, the secreted fluids, and air. 2d, Muscular contraction, sense, “the energy of the brain in thinking, and in exciting passion or emotion.”—Death is consequent on the cessation of their agency on the living system.

3. The principle on which the phenomena of life depend, is called *Excitability*; the agents affecting this principle, are called the *exciting powers*; and the effect produced by the latter on the former, is named *excitement*.

4. The excitability differs in different individuals, and in the same individual at different times. Accordingly, the exciting powers will vary in their effects, in proportion to the vigour of the excitability.

5. Exciting powers should be also named stimuli. They are either general or local. The first are those which act on the excitability in such a manner as to produce excitement over the whole system. The second act only on the part to which they are applied.

6. Life is a forced state, and consequently its continuance in perfection depends on the due action of the stimuli on the excitability. Health, then, is maintained by the exertion of natural stimuli on the excitability.

7. But whenever they are unnatural, or act with too much energy, the excitability is exhausted, and the excitement becomes greater than it ought to be. This is a state to which Dr Brown gave the name of *asthenic diathesis*, which predisposes to *asthenic disease*. This diathesis, or predisposition, may be increased very considerably by injudicious management.

8. After excitement has been carried to its utmost pitch, it ends in indirect debility, which gives rise to *asthenic diseases*.

9. Indirect debility is induced by the excessive action of stimuli, or by their too great intensity. The excitability is then supposed to be exhausted.

10. Direct debility, is, on the contrary, induced by a defect in the stimuli, or by their feeble action.

11. These two species of debility differ most essentially, and are sufficiently characterized. They exist in health as well as in disease. Indirect debility occurs in old age, and direct debility in youth or infancy.

12. Sleep is the effect of both kinds of debility, either separate or conjunctly.

13. Every power that acts on the living frame is stimulant. This principle is supposed not to be affected by any circumstances whatever.

14. Excitability exists in the medullary portion of the nerves and in the muscles. It sympathises in every part of the system. That is, different parts can never be in opposite states of excitement.

Dr Brown contrived two scales, the first of which he divided into 80 degrees, shewing the quantity of excitability given to every being at the commencement of its existence. The second “points out the ascending and descending progression which the exciting powers observe in acting on the excitability.”

Such are the outlines of the system of Dr Brown. With all its ingenuity we must still hesitate in adopting it, until we can obtain something more than the blending of some truth with much conjectural hypothesis. We dislike the phraseology, and still more the arrogance, with which both the author and his followers have asserted their infallibility.

Still, however, it cannot be denied, that some of the conclusions have proved more useful than was at one time expected.

It, fortunately, is a matter of very little moment, how physicians theorise. Few, even the devoted disciples of Dr Brown, would follow the example of that gentleman, and venture on prescribing wine, high living, and opium, in gout. The use so liberally made by Brown and his proselytes of the term demonstration, as applied to the doctrines above sketched, cannot fail to excite the ridicule of those who, from having attended to the nature of medical inquiries, have been convinced that doubt and obscurity must overshadow every step of the physiologist and physician, until certain fundamental facts be ascertained, which the present faculties of mankind are not likely to develop. See *Brown's Writings and Life*, by Dr Beddoes; and *The Works of Dr John Brown, with a Biographical Account of the Author*, by William Cullen Brown, M.D. (c. m.)

BROWNISTS, a religious sect, which owed its origin to Robert Brown, an English divine of the sixteenth century. He was first a schoolmaster, and next a lecturer at Islington; and soon distinguished himself by travelling through various parts of England, and inveighing against the discipline and ordinances of the established church. Being brought before the bishop of Norwich, he was, in the year 1580, committed to the custody of the sheriff of the county; but, upon an acknowledgment of his offence, he was released. This salutary chastisement, however, soon lost its effect upon Brown's ardent and captious spirit; he returned to his former ambulatory life; preached and wrote against the church of England; and suffered frequent imprisonments, as a punishment for his offences. At length his followers assumed the name of Brownists; separated from the church; and formed themselves into a society, which refused to join with any other Christian society in the public offices of religion. Brown's restless and turbulent spirit soon made it necessary for him to quit the kingdom; and having settled at Middleburgh, in Zealand, in 1582, he and his followers obtained leave of

the States to worship God in their own way, and to form a church according to their own model. There he might have lived and died unmolested; but opposition seems to have been more congenial to his spirit. In a few years he returned to England, and brought with him all his former hostility to the church. Having been cited to appear before the bishop of Peterborough, he refused to comply; and the sentence of excommunication was pronounced upon him, as a punishment for his contempt. It is said, that he was deeply affected with the solemnity of that censure; and having some years afterwards renounced his principles of separation, and returned to the communion of the church, he was preferred to a rectory in Northamptonshire. There, according to Fuller, he lived an idle and dissolute life, neither beloved nor respected; and having quarrelled with the constable of his parish about the payment of certain rates, he was, by order of a justice of the peace, thrown into gaol, where he died in the year 1630, in the 81st year of his age, after having boasted that he had been committed to no fewer than thirty-two prisons, in some of which he could not see his hand at noon-day.

The followers of this extraordinary man differed, not in doctrine, but in discipline, from the church of England; y^e they carried their hostility to her so far as to maintain, that her ministers were unlawfully ordained, that her discipline was Popish, and that her sacraments and institutions were invalid. Nay, they not only renounced communion with her, but also with all other religious societies, whose constitution was different from their own. In the formation of their churches, it was required that the members should subscribe a confession of faith, and an obligation to conduct themselves according to certain specified rules. When they became too numerous to meet in one place, they divided into separate societies or congregations, each of which was accounted a complete church, and enjoyed all the rights and privileges competent to an ecclesiastical community. The whole power of governing each congregation, of admitting and excluding members, and of deciding all controversies, resided in the people; and each member was allowed an equal share in the government, and an equal right to order all matters for the good of the whole society. No one church was entitled to exercise jurisdiction over another; but each might give the other counsel or admonition, when at any time their conduct was deemed disorderly, or when they departed from the fundamental truths of religion; and if the offending church did not receive the admonition, the others were commanded to withdraw from communion with them, and publicly disown them as a church of Christ. It was the congregation, also, that elected the pastors, and other officebearers of the church, for the ministry of the word, and for taking care of the poor; to which they were appointed by fasting, and prayer, and imposition of hands; but reserving always the power of dismissing them from those offices, whenever they should think such a change conducive to the spiritual benefit of the community. For these pastors assumed no authority over the congregation, nor differed in any respect from their Christian brethren, except in

the privilege of discharging the duties of the ministerial office. Neither was that office peculiar to them alone; for any member of the congregation might publicly teach and exhort; and many availed themselves of that privilege, when the discourse of the ordinary pastor or teacher was finished. On the other hand, the powers of the church-officers were confined within the narrow bounds of their respective congregations. No pastor was permitted to preach, nor to administer the sacraments, except in his own church; and all set forms of prayer in public worship were strictly prohibited. In a word, every church, or society of Christians, meeting in one place, was, according to the Brownists, a *body corporate*, having full power within itself to regulate all matters for the good of the community. It would seem that Brown had wished to form his church upon the model of the infant church, in the days of the apostles, without considering the important changes, both civil and religious, which have taken place in the state of the world since that time, and the influence which these must necessarily have on all ecclesiastical establishments.

After continuing for a period of nearly one hundred years, the Brownists gave birth to the Independents, who adopted the greater part of their discipline. See Neal's *Hist. of the Puritans*, vol. i. p. 328; Mosheim, vol. iv. p. 400; and *Biog. Brit.* vol. ii. (A. F.)

BROWNEA, a genus of plants of the class Monadelphia, and order Endecandria. See BOTANY, p. 261.

BRUCE, ROBERT, King of Scotland, was born on the 11th of July 1274. He was the son of Bruce, Lord of Annandale, and Martha, Countess of Carrick, and the grandson of Robert Bruce, the competitor with Baliol for the Scottish throne. Exiled from his native country by the ambition of his father, he passed his youth at the court of England. In expectation of obtaining a crown, the elder Bruce had enlisted under the banners of Edward, and carried arms against his countrymen. After the battle of Falkirk, he agreed to a conference with Sir William Wallace.* On the banks of the Carron, that undaunted warrior vented the indignant feelings of his generous spirit. He upbraided Bruce as the mean hireling of a foreign master, who, to gratify his ambition, had sacrificed the welfare and independence of his native land; and who, instead of courting the glorious distinction of delivering his country, or of falling in asserting her liberties, had cowardly deserted that post which his birth and fortune had entitled him to assume. These reproaches sunk deep into the heart of Bruce. They opened his eyes to the degeneracy of his conduct, and it is said that he died soon after of grief, occasioned by reflecting on his past meanness. He, however, bequeathed to his son the legacy of atonement, and exhorted him, with his dying breath, to revenge the injuries of his suffering country. Young Bruce was eminently qualified for becoming the champion of independence. Educated at the court of a warlike monarch, few could equal him in the exercise of arms; and with a mind intrepid and enterprising, he possessed a constitution capable of bearing the depriva-

* Though this conference has been mentioned by all the Scotch writers, yet it has been represented by Lord Hailes as a story absurd in itself, and without any foundation in truth. Where its absurdity lies, we leave our readers to discover. With regard to its validity, we may observe, that his Lordship's remarks refer entirely to young Bruce, and consequently cannot here apply; and we may mention, that some historians not only affirm that the elder Bruce was in the battle of Falkirk, but that he was at the head of the Galloway men, his vassals, and that it was owing to his attacking the Scottish army in the rear, that the brave Wallace was compelled to retreat. Guthrie's *Hist. of Scot.* vol. ii. p. 116.

tions and hardships of a military life. The injunctions of his dying father were engraven on his heart; and the death of Wallace, leaving the Scottish patriots without a leader, opened the way for Bruce's exaltation to that arduous station. From that hour he thought only of delivering his country from oppression, and his whole soul was absorbed by the mighty attempt. Cumming, Lord of Badenoch, who had been Regent of Scotland in the name of Baliol, and who had often fought by the side of Wallace in resisting the tyranny of the English, was his only rival for the throne, and the chief bar to the success of his design; and he could not but perceive, that openly to assert his right to the crown in the face of such a powerful adversary, was only to involve his country in deeper misery, and to expose his cause to certain destruction. It was necessary, therefore, to secure the co-operation of Cumming in this great undertaking, and accordingly he entered into a compromise with that nobleman, by which he agreed to resign to him all his family estates, on condition that he would give him his utmost assistance and support in the execution of his design.* But the treachery of Cumming relieved him from his engagement; and, by exposing him to the suspicions of the King of England, hastened the accomplishment of his determined purpose. Bruce, being secretly informed of the hostile intentions of Edward, who had attempted to draw his brothers into his power, and had determined to free himself from future uneasiness, by extirpating the whole family, found means to elude his vigilance, and hastening to Scotland, assembled his friends in the castle of Lochmaben, and avowed to them his intention of assuming the crown. They all swore to live and die in his service—they acknowledged him as their sovereign, and immediately proceeded to take measures for restoring liberty to their country. Their safety and success imperiously demanded the death of Cumming. His treachery and his power rendered him obnoxious to their cause, and they could not expect that he would abandon the interests of Edward to support the pretensions of a rival. Though the circumstances attending his death have been disputed by historians, yet it is allowed by all that he fell by the hand of Bruce. This deed sealed the revolt of the patriots. The honour and the interest of Edward called loudly for vengeance; and the open violence with which it was executed, deprived them of all possibility of reconciliation. Bruce had now no alternative left but death or a crown; and he determined to persist, at every hazard, in his design, rather than expose himself to the ignominy of submission. He was crowned at Scone, on the 27th of March 1306. But such a series of disasters succeeded, as had almost crushed his exertions and his hopes. His wife and daughter fell into the hands of the English, and he himself and a few followers, after having endured all the

extremities of hunger and fatigue, were at last compelled to take refuge from the fury of their enemies in the island of Ràchrin.† Here he and his party were hospitably received, and provided with every necessary; and here he so effectually concealed himself, that he was generally believed to be dead. Fearing, however, that such a report might discourage his adherents in Scotland, and induce them to submit to Edward, he resolved to make another effort for the recovery of his rights. Passing secretly over into Arran, he dispatched a faithful domestic into Carrick to discover how his ancient vassals stood affected to his cause. He himself, with his friends, soon after followed. Upon their landing, they immediately learnt that the whole country was in the possession of the English, and that there appeared no hope of assistance. Surrounded with dangers, Bruce hesitated for a moment upon what to resolve; but his valour and despair soon dispelled every consideration of danger.

"Here shall no peril that may be
Drive me eftsouns into the sea;
Mine aventure here take will I,
Whether it be easeful or angry."

BARBOUR, p. 91.

With three hundred followers, he surprised the English in their cantonments, took the castle of Turnberry, and put the garrison to the sword. From that day his party rapidly increased; and, after eight years of incessant warfare, attended by the most glorious successes, the decisive battle of Bannockburn blasted the hopes of Edward, and secured the independence of Scotland. Bruce was now firmly established upon the throne, and from being a wandering outcast, fighting for his very existence against the tyranny of Edward, he became a powerful monarch, carrying terror and desolation into the territories of his adversary. The remainder of his life was, in a great measure, spent in active warfare, but his offensive operations were too extensive to be completely successful; and his attempt upon Ireland was undertaken, not so much to harass his enemy, or to extend his power, as to gain a kingdom for his brother Edward, whose ambition, unable to brook the authority of a superior, would otherwise have embroiled his country in a civil war. Worn out, at length, with the fatigues and exertions of an eventful life, and after having concluded a peace with England, most advantageous and honourable to Scotland, and worthy of her long struggle for independence, Bruce died at Cardross, on the 7th of June, 1329, in the 55th year of his age, and the 24th of his reign. On his death-bed, he requested, that as he had often purposed to visit the Holy Land, his heart should be carried thither, and deposited at the sepulchre of our Saviour. Sir James Douglas, who had been long his companion in arms, and his

* Some historians have been inclined to suspect the truth of any agreement between Bruce and Cumming relating to the throne; and they account for the quarrel between these noblemen, by supposing that when Bruce demanded of Cumming whether he would befriend him in his design, Cumming dropped some warm words, which occasioned his being wounded by Bruce. Guthrie's *Hist. of Scot.* vol. ii. p. 173. Others again deny that Bruce had any design of asserting his claim to the crown, and that the death of Cumming was the consequence of a hasty quarrel between these proud-spirited rivals. Hailes' *Annals*, vol. i. p. 292. This agreement, however, is mentioned both by Barbour, 17, and Fordun, xii. 5; and Hemmingford seems also to insinuate treachery on the part of Cumming; for, when speaking of the conference between these noblemen, he says of Bruce, "*Capit improperare ei de seditione sua, quod cum actu saecrat apud Regem Anglie, et suam conditionem deterioraverat in damnum ipsius.*" T. i. p. 219. We believe that the real nature of this fatal quarrel is unknown. In such circumstances, therefore, we thought it best to follow the common tradition.

† This island lies off the coast of Ireland, and it is said that Bruce here composed a Latin consolatory poem, of which two lines are only now extant.

"Ni me Scotorum libertas prisca moveret,
Non tantum paterer orbis ob imperium."

faithful adherent through every variety of fortune, was chosen to fulfil the wishes of his dying master. But this mournful duty was never performed; for we are informed by Barbour, that Douglas, on his way to Jerusalem, landed in Spain, where he fell in battle against the Moors. The royal heart was brought back to Scotland, and buried in the church of Melrose.

Bruce was twice married; first to Isabella, daughter of Donald, Earl of Mar, by whom he had Marjory, married to Walter, the Stewart of Scotland, whose son, Robert II. was the first monarch of the line of Stuart. By his second wife, Elizabeth, daughter of Aymer de Burgh, Earl of Ulster, he had David II. who succeeded him, and two daughters.

As a warrior, Robert Bruce found no equal in the age in which he lived; and it is impossible, by any delineation of ours, to do justice to that undaunted valour which no dangers could dismay; to that energy of soul which rose superior to every misfortune; and to that unwearied perseverance which, under circumstances the most adverse and distressful, led him, with a steady step, to the accomplishment of his design. In Scotland, his name will ever be remembered with gratitude and admiration. From the many salutary regulations which he introduced into his government, he seems to have had a sincere affection for the liberties of his subjects; and, by a wise and vigorous administration, he curbed the irregularities of a people who had been long accustomed to anarchy, bloodshed, and plunder. See Guthrie's *Hist. of Scot.* vol. ii. p. 163, &c.; Hume's *Hist. of Eng.* vol. ii. p. 323, &c.; Hailes' *Annals of Scot.*; and Barbour's *Life of Bruce*. (h)

BRUCE, JAMES, one of the most enterprising of modern travellers, was born at Kinnaird, the residence of his family, in the county of Stirling, in Scotland, on the 14th day of December, 1730. Bruce's family was ancient and respectable, and many of his ancestors had made a distinguished figure both in church and state. Of the early life of Bruce few particulars are known; though strongly formed, he did not promise, when a child, that athletic constitution and stature which he attained in manhood: and his temper, contrary to what he afterwards assumed, was gentle and quiet; as he advanced in life, it became bold, hasty, and impetuous, accompanied however with a manly openness, that shewed a warm and generous heart. When about twelve years of age, he was sent to the school at Harrow on the Hill, in the vicinity of London; where he is said to have made rapid progress in classical literature. He was particularly attentive in acquiring the accomplishments of fashionable life; he spent most of his leisure time in sports of the field, and attained great dexterity in shooting; a qualification which he turned to good account in the course of his hazardous travels. He was intended originally for the profession of the law; he does not appear to have been fond of this profession; and his copy of *Heineccius's Institutes*, which is still in the possession of the family, is scribbled over with verses from the Italian poets. At last he relinquished the study of the law altogether, and turned his thoughts towards India; he was prevented however from carrying his intentions into execution, by forming an acquaintance with the family of a Mrs Allan, the widow of an eminent wine merchant, whose daughter he married; in consequence of this connection he settled in London, as a partner in the wine trade with Mrs Allan's son. In a few months after their marriage, Mrs Bruce exhibited

evident symptoms of consumption; and it was deemed necessary to try the mild climate of the south of France. She expired, however, at Paris; and such was the bigotry of the Roman Catholics at that time, that she was scarcely permitted to die in peace, and her distracted husband had to steal for her a grave at midnight, that he might avoid the unhallowed insults which bigotry thought it meritorious to offer to the remains of a heretic.

Mr Bruce continued for some time in the wine trade, and in the way of his business travelled over the most of Spain, Portugal, and the Netherlands. When at Brussels he was involved in a quarrel with a person who had behaved rudely in his presence, to a young gentleman, whose appearance had prepossessed Bruce in his favour. This quarrel was decided by the sword; and Bruce having wounded his antagonist, as it was thought mortally, was obliged to leave the Netherlands. Having received accounts of his father's death, who died at Edinburgh, in 1758, he resolved to return to England. Though he succeeded to a respectable fortune, it was by no means adequate to the demands of his ambition. As he possessed great facility in acquiring languages, he began to devote himself to the study of the Arabic and Ethiopic, prompted at first in all probability, by mere curiosity; but it is not unlikely that the world owes to this circumstance the fruits of his valuable travels. In 1761 Bruce withdrew from the wine trade, which he had carried on for seven years, in company with his brother-in-law. He now began to engage in politics, and proposed the plan of an expedition against Ferrol, which was favourably received by the ministry, and even resolved on, but never carried into execution. Bruce being disappointed in his views, resolved to return to Scotland, and spend his time as a country gentleman. Lord Halifax laughed at the idea, and suggested Africa to him as a proper field for enterprise and discovery; and that he might go under the protection of a public character, it was proposed to send him as consul to Algiers. Bruce acceded to these proposals, and left Britain in the end of June 1762. He passed through France and Italy, and carried with him from the latter country an artist to assist him in his drawings. His residence at Algiers was rendered extremely uncomfortable, and he was at last superseded by the influence of a party. He obtained permission from the Dey to travel through the interior provinces, from thence he passed into Syria, visited Balbec and Palmyra, and at last prepared for his great enterprise, the journey into Abyssinia, to explore the sources of the Nile. As he had resolved to travel in the character of a physician, he received books and instructions respecting the diseases of the east from Dr Russel at Aleppo. He sailed up the Nile a considerable way, and then joined the caravan to Cosseir on the Red Sea; from thence he passed over to Jidda, and visited a considerable part of the sea coast of Arabia. The journal which he kept of the occurrences in Egypt and Arabia is extremely interesting; but our limits prevent us from entering into a detailed account. After furnishing himself with numerous letters of recommendation, a precaution which he never neglected, and to which he owed his safety, he sailed for Massowah, the only practicable entrance into Abyssinia. He was here exposed to the greatest danger from the villany of the Naybe, and with difficulty escaped with his life. It is quite impossible to give an account of his proceedings in Abyssinia, of

the honours which were conferred upon him, of the strange occurrences which he records, or of the difficulties which he encountered in prosecuting his grand object, the discovery of the sources of the Nile. He at last accomplished his object, and his feelings on that occasion were of a very singular and mixed character: at first he felt a degree of exultation that he had seen what he imagined no European had ever seen before him, but instantly the most afflicting dejection overpowered his spirits when he compared the small utility likely to result from his labours, with the difficulties which he had already experienced, and which he had again to encounter. Abyssinia was at that time distracted by factions, and involved in a civil war. With great difficulty he obtained leave to return; and to avoid the danger which he apprehended at Massowah, he resolved to return by Sennaar. The dangers and difficulties which he encountered in this route were almost unparalleled. We have no hesitation in saying, that the whole of his narrative, from the time that he entered Abyssinia, till he reached Syene in Egypt, by the way of Sennaar, is the most interesting detail to be found in any language. His constitution had been much impaired by his residence in Abyssinia; and the Guinea Worm which had entered his leg, having been broken in the extracting, had almost cost him his life. He resided for a considerable time after his return, in the south of France, for the benefit of his health, and lived on the most intimate footing with the celebrated Count de Buffon, who acknowledges his obligations to him for several important communications on the subject of natural history. He at last settled in his native country, and his paternal inheritance. In 1776, he married a daughter of Thomas Dundas, of Fingask, Esq., by whom he had three children, two of whom, a son and a daughter, are still living. After he settled at Kinnaird, his time was chiefly spent in managing his estate, in preparing his Travels for the press, and other literary occupations. He retained to the last his fondness for field sports. He was preparing a second edition of his Travels, when death prevented the execution of his design. On Saturday, the 26th of April 1794, having entertained some company at Kinnaird, as he was going down stairs about eight o'clock in the evening, to hand a lady into a carriage, his foot slipped, and he fell down headlong from about the sixth or seventh step from the ground. He was taken up in a state of insensibility, without any apparent contusion, and expired early next morning.

Such was the end of this celebrated traveller, who uniformly ascribes all his wonderful escapes to the hand of Providence, by whose inscrutable decrees he was thus summoned from the world. His stature was six feet four inches; his person was large and well proportioned; and his strength correspondent to his size and stature. He found no difficulty in acquiring languages of any kind; he understood French, Italian, Spanish, and Portuguese. Besides Greek and Latin, which he read well, he knew the Hebrew, Chaldee, and Syriac; he read and spoke with ease, Arabic, Ethiopic, and Amharic: he was a good practical astronomer, and his drawings are admirable. No author ever experienced such ungentlemanlike treatment from reviewers and other petty assailants. A parcel of contemptible fools, who had never been out of sight of the smoke of London, had the audacity to aver that he never had been in Abyssinia, and that his book, from beginning to end, was a fabrication. Bruce's temper, which was naturally

haughty, served to provoke these attacks; and his vanity, which was very considerable, afforded his enemies an opportunity of saying, that he had magnified his exploits and his dangers at the expense of truth. These insinuations, however, gradually died away; and the progress of discovery, though not in the same field, served to confirm all his statements.

But a more serious attack has been made on him lately, by Lord Valentia, who pretends to have detected, by actual observation, not only his inaccuracies, but his falsehoods. This has encouraged some of the journals in which Bruce had been originally assailed, to renew the attack, and to assume credit for their discernment. Lord Valentia did not enter Abyssinia himself, but he dispatched Mr Salt, one of his attendants, whose attention seems to have been particularly employed in endeavouring to overturn the authority of Bruce. Mr Salt has been a second time in Abyssinia, but has not as yet favoured the world with his second thoughts on the subject. We are not afraid, however, to affirm, that no traveller, and no writer of any description, has done so much to confirm the accuracy of Bruce. We beg leave to direct the attention of our readers to the points on which he attacks the veracity of Bruce.

When Mr Salt's party had reached Hamhammou, they were stopt by a violent storm; upon which he observes, that Bruce was exposed to a storm in the same place, "which, however, he describes, says he, with some exaggeration." Nothing can manifest a stronger propensity to carping and unfairness than this observation. How could Salt know that Bruce's description of the storm was exaggerated? Was it the identical storm which Bruce described that Mr Salt witnessed? Or did the spirit of the storm appear to him to complain of misrepresentation? In fact, every step that he takes serves to confirm the minute accuracy of Bruce. When he arrives at Tubbo, he is forced to confess, "Bruce has well described this place." Bruce says, that between Shillokeeb and Hamhammou, he first observed the dung of elephants. It is curious enough, that when Mr Salt comes to the same place, he makes exactly the same observation. Bruce, however, is by far the most accurate *coprologist* of the two; for he informs us, that the dung which he observed, was filled with the indigested branches of trees, which gives us some insight into the habits of the elephant; but Mr Salt passes on satisfied, with barely introducing his readers to this elegant phenomenon. He passes the tribe of the Hazorta, whose residence he admits to be admirably described by Bruce, and at last comes to the famous mountain of Taranta. He is very severe on Bruce for exaggerating the difficulties of the pass, which he and his party cleared in a few hours, whilst Bruce's party took part of two days. He takes no notice, however, of Bruce's quadrant, which took eight men to carry it, whilst Mr Salt's principal box was carried, as he himself informs us, by a boy of thirteen years of age. Besides, Bruce tells us, that the asses turned and ran down the hill to a great distance, which caused a general halt till they were recovered. If Mr Salt had not been blinded by prejudice, he would have acknowledged that none of these causes of obstruction operated in his case; and that, therefore, the ascent of the mountain was comparatively easy. Besides, the road on the mountain was excessively bad in Bruce's time, which Mr Salt confesses was not the case when he passed it.

Mr Salt makes another sneer at Bruce, when he says,

"we passed on without observing Troglodytical caves, or being disturbed by hyenas." What a pity that travellers have not better memories, or a little more foresight and consistency! He had said only a few pages before, "we passed a *cave* inhabited by a family of the natives." And he tells us, afterwards, that the usual mode of building in Abyssinia, is to choose a projecting rock, and after building two side walls, to lay on a roof level with the rock above, which gives the houses all the appearance of caves. He also confesses that many of the churches are more than half caves, the greater part of them being cut out of the solid rock. And as to the hyenas, he had not proceeded far till he tells us the whole party were kept awake by the barking of the dogs, on account of the near approach of these ravenous animals. Bruce describes admirably the appearance of Taranta, covered on the sides with that singular tree the kolquall, and on the top with the berry-bearing cedar. Mr Salt confirms this description in every particular, but falls infinitely short of the graphic style of his predecessor.

Let us now attend Mr Salt to a *Brind* feast, which excited the wonder and incredulity of the public so much on the publication of Bruce's book. Mr Salt denies expressly that the flesh is eaten while the animal is alive; and yet both he and Captain Rudland, who accompanied him, declare, that *the flesh quivered all the time that they were eating it*; and it is not easy to conceive how this could be the case if the animal was perfectly dead before it was cut up. Bruce says that it was not fashionable for people of distinction to feed themselves, but that they had persons employed to put the meat into their mouth: this Mr Salt denies. But Captain Rudland, who kept a separate journal, says expressly, that they fed one another as boys do magpies in England; and that the Ras, by way of showing his attention, sometimes stuffed him till he was like to burst. Mr Salt declares it as his opinion, that the lascivious scenes which Bruce describes as taking place at the *Brind* feasts, had no existence but in his own imagination; and yet both he and Captain Rudland say, that they often heard such conversation, and saw such scenes, even in the presence of the Ras and his ladies, as decency would not permit them to describe. Notwithstanding Mr Salt's incessant carping at Bruce, he confesses that his account of the transactions in Abyssinia, whilst he was there, is true in the minutest particular: and he says that he shall never forget the astonishment expressed by the natives at the knowledge he displayed of their history. They looked upon him as a superior being when he exhibited Bruce's drawings of Gondar. All the persons whom Bruce mentions were well known; many of them were alive, and spoke of him to Mr Salt with great affection. They all agreed that he was a great favourite of the king of the Iteghe and of Ozoro Esther. Mr Salt met with the person who was sent to recover Bruce's baggage when he was robbed in his first attempt to reach the sources of the Nile, and also with an old chieftain who was present at the curious hunting match at Tcherkin, when Bruce was on his way to Sennaar. All the persons whom Mr Salt conversed with, agreed in saying that Bruce had visited the sources of the Nile: but it seems they also all agreed in saying that he never was governor of Ras-el-Feel: and on this account Mr Salt thinks he is authorised to say, Bruce has told a direct falsehood. We shall submit to our readers a specimen of Abyssinian evidence on this

subject, and shall leave lawyers and logicians to draw the conclusion; only premising, that, even according to Bruce's own account, he never took possession of the government of Ras-el-Feel in person, but administered it by deputy.

"At Suez, March 1793," says Browne, in the preface to his *Travels*, "I met an Armenian merchant, who had formerly traded to Abyssinia, and seemed a man of intelligence. He told me that he was at Gondar when Bruce was there: and that *Yakub* (the name by which Bruce was known in Abyssinia) was universally talked of with praise. This merchant narrated, of his own accord, the story of shooting a wax candle through seven shields. *He observed, that Bruce had been appointed governor of Ras-el-Feel, a province where Arabic was spoken.*" "In Dar-Fur," continues the same traveller, "I met a Bergoo merchant, named Hadje Hamed, who had long resided at Sennaar, and was in Bruce's party from Gondar to Sennaar. He said that *Yakub* had been highly favoured at the Abyssinian court, and lived splendidly. He was often observing the stars, &c. *Both my informers agreed that he had been governor of Ras-el-Feel.*" If this evidence does not overturn that which Mr Salt collected in Abyssinia on this subject, it at least completely neutralizes it. If, as Browne's words seem to imply, the Armenian merchant mentioned, of his own accord, without being asked, that Bruce was governor of Ras-el-Feel, we may consider the question as decided in favour of Bruce.

We shall conclude this article in the words of that accurate and profound scholar, Dr Vincent, who seems to have formed a very correct estimate of Bruce's character. "We ought not to be ungrateful to those who explore the desert for our information. Bruce may have offended, from the warmth of his temper: he may have been misled, by aspiring to knowledge and science which he had not sufficiently examined; but his work throughout bears internal marks of veracity, in all instances where he was not deceived himself; and his observations were the best which a man, furnished with such instruments, and struggling for his life, could obtain." See *Bruce's Travels*; *Murray's Life of Bruce*; *Browne's Travels in Egypt*; and *Vincent's Periplus of the Eryth. Sea*, p. 93. (g)

BRUCEA, a genus of plants of the class Diœcia, and order Tetrandria. See BOTANY, p. 329.

BRUCKER, JOHN JAMES, a learned German author, well known by his laborious and original researches into the history of philosophy, was born at Augsburg, in Swabia, on the 22d of January 1696. He prosecuted his studies at the university of Jena, where he afterwards continued to reside, for a considerable period, in the capacity of a tutor or private teacher, and returned to his native city in the year 1720. After having attained to some eminence in the clerical profession in other parts, he was, at length, in 1740, appointed pastor of the church of St Ulric's, and senior minister of Augsburg, where he died in the month of November 1770.

Brucker was eminently distinguished by the extent, depth, and variety of his historical and literary attainments; by his indefatigable industry in research, and by the judgment he displayed in the application and arrangement of the knowledge he had acquired. Besides several useful works on subjects connected with ancient and modern literature and philosophy, he is principally known at home, and among foreigners, as the author of the *Historia Critica Philosophiæ*, which was first pub-

lished at Leipsic in 1742-44, in five volumes quarto, and afterwards, in 1767, and following years, in an enlarged and improved edition in six volumes. In this excellent work, the author gives a biographical sketch of the lives of the different philosophers respectively; reviews their writings, explains their various systems and doctrines, and verifies his narrative by means of a copious exhibition of authorities. These volumes, indeed, contain a biographical and critical account of the ancient and modern philosophers and their works, rather than a systematical history of the progress of science; nevertheless they certainly constitute a most valuable repertory of knowledge, in that particular department of literature, and have proved a highly useful book of reference to those who have since devoted themselves to philosophical researches.

An abridged translation of this work was published by Dr Enfield, in two volumes quarto, London, 1790. Brucker also prepared an excerpt from his larger work, entitled, *Institutiones Historiæ Philosophicæ* 1746, 1756. *Denkwürdigkeiten aus dem Leben ausgezeichn. Teutsch. d. 18ten. Jahrhundert.* Schnepfenthal, 1802. (z)

BRUGES, formerly a city of the Austrian Netherlands, and a bishop's see, now a city of the French empire, and capital of the Prefecture of the department of the Lys, is situated in a beautiful plain about eight miles from the sea. It is a spacious and well built town, about a league and a half in circumference; but many of the houses are very old, which give it rather a sombre appearance. Its principal buildings are,—the stadthouse, which stands in the great market-place, and has a tower of a very lofty and curious structure; it is square for a very considerable height, and, instead of being surmounted by a spire, another octangular tower is placed upon it almost as high, which has, however, rather a surprising than a beautiful effect. The cathedral is a massive and ancient building, but many of its ornaments are disfigured by the most incongruous modern additions. The church of Notre Dame is a very beautiful structure, and its lofty steeples serve as a sea-mark to the ships which frequent the port of Ostend. It contains two tombs of gilt copper, of extraordinary magnificence; and in the treasury are preserved the rich vestments of Thomas a Becket, adorned with precious stones. Besides these, Bruges has several hospitals and schools, where 300 poor children are maintained and educated; and no place in the low countries is more distinguished for the provision which it affords to widows and orphans.

Bruges formerly held the first place among the cities of the Netherlands; and, in the 13th and 14th centuries, was the greatest emporium in Europe. From the imperfection of navigation, a voyage between the Baltic and Mediterranean could not be performed in one season; Bruges was therefore selected as the most convenient station for establishing a magazine, about midway between the commercial cities of the North and those of Italy. Consequently, this city became the staple for the woollen and linen manufactures of the Netherlands, the naval stores and other commodities of the north, and for the Indian as well as domestic productions imported by Venice and the other Italian states. Consuls from every nation resided here, and seventeen palaces or houses are still shewn as their ancient habitations. It carried on also a considerable trade with England; and it was declared, by a treaty, to be the only market of the Hans-towns in the Low Countries. The herring-fishery was prosecuted here to a great extent. Indeed, the inhabi-

tants of Bruges were the first who made it an object of commercial speculation; and it was to this city that the Hollanders were indebted for their knowledge of curing their herring, and also for this branch of commerce, which was the first foundation of their maritime strength.

Bruges, now the first in commerce, soon became also the first in opulence and grandeur; and we are told by Guicciardini, that Joanna of Navarre, queen of France, having been some days in Bruges in 1301, was so struck with the splendid dress of the citizens, and the magnificence of their buildings, that she exclaimed, with envy and indignation, "I thought that I had been the only queen here, but I find that there are many hundreds more." This city, however, which had risen so rapidly to such an eminence in the commercial world, and had flourished so long under the auspices of the Dukes of Burgundy, as suddenly declined. Its success had excited the envy of Antwerp and Amsterdam; and its sovereign, the Archduke Maximilian, against whom they had rebelled, and whom they had even arrested, assisted by these cities, blocked up the port of Sluys in 1487, which destroyed its principal communication with the ocean. During this rebellion, which lasted for fourteen months, Amsterdam and Antwerp seized the opportunity of drawing its commerce to their own ports, and thus rose upon its ruins to be its rivals, and soon its superiors. Being thus reduced to great straits, and fearful of worse consequences, Bruges implored the clemency of its prince, when 56 citizens were condemned to death, a considerable number banished, and the city heavily fined. But from this blow it has never been able to recover. Much of its commerce was removed to Dort, and afterwards to Antwerp, where many of its principal merchants also retired; and the improvements in navigation had rendered its convenience as an emporium for merchandise less necessary. Much as it has fallen, however, from its former grandeur, it still retains a traffic equal to any city in Flanders. Besides its easy communication with Antwerp, Louvain, Mechlin, and Brussels, it communicates also, by means of navigable canals, with Ghent, Sluys, Ostend, Nieuport, Furnes, and Dunkirk, &c.; and this communication is extended by the rivers Scheldt, Scarpe, and Lys, as far as Tournay, Lille, Menin, and Douay. Its port is at the extremity of the canal which leads to Ostend, and is capable of containing 100 merchant-vessels; and, from the sluices which are constructed on the *Reye* canal between Bruges and the sea, at Lecke and Plassendal, which are defended by forts, vessels of 400 tons can easily approach the very centre of the city.

Bruges has various manufactures of broad says, serges, baize, and other woollen stuffs; also dimities, camlets, and fine linens,—which last are equal to those of Holland, and are sold in a market held every week under the arcades of the Hotel de Ville. Its laces pass for those of Mechlin, and are sold at the same price. Besides its manufactures, Bruges exports a considerable quantity of corn, and all kinds of seeds proper for making oil, particularly *colzat*. Its imports are nearly the same with the other cities of Flanders and Brabant.

It was at Bruges, in 1430, that Philip the Good, Duke of Burgundy, instituted the illustrious order of the Golden Fleece, upon his marriage with Elizabeth, princess of Portugal. The property belonging to this order was called the *Franc of Bruges*, and contained 37 villages, which enjoyed considerable immunities. The fortifications of this city are very indifferent, and have never

been able to stand a long siege. It was several times taken and retaken during Queen Anne's war, and was at last surrendered to the allies, December 30th, 1709. The French troops entered it on the 24th of July 1794, when the magistrates signed a formal submission to the republic of France.

Bruges has a prefect, a secretary-general, a receiver-general, a payer of the public money, and a director of the customs. It has also a chamber and tribunal of commerce. Population 35,000. North latitude, $51^{\circ} 11' 30''$; east longitude, $8^{\circ} 5'$. See Peuchet *Dictionnaire*, &c.; and Tynna *Almanach du Commerce*, 1811. (h)

BRUGUIERA, a genus of plants of the class Dodecandria, and order Monogynia. See BOTANY, p. 220.

BRUN, CHARLES LE, was an artist of such eminence, as to add lustre to the age of Louis XIV. He was born in 1619; and, as his father (who was a sculptor by profession) was descended from a Scotch family, it is probable that the name was originally written Brown. He was not an exception from the general rule, that great excellence in any of the arts, is the result of great industry, co-operating with strong genius. As early as the age of four, Le Brun is said to have found a substitute for the pencil, in the same expedient which supplied young Pascal with the means of describing his diagrams,—the use of coals taken from the hearth. His first production, which obtained particular admiration, was a portrait of his grandfather, taken when he was not more than twelve. Fortunately, his genius did not want all the encouragement and aid which it deserved: After having studied with great success in the school of Vouet, in his 23d year he was sent by the Chancellor Seguier to Italy, where he pursued his art during six years, under the inspection and the roof of Poussin. Though his genius led him to great designs, yet he was so well aware of the advantage of correctness in the minutest things, that he made the manners and costume of antiquity a particular study during the period of his education, which was happily prolonged till his 30th year. He now returned to Paris, where he was soon distinguished by a court the most polished in Europe, and a monarch who added to his other ambition, the more honourable emulation of the character of the most munificent patron of the fine arts. He was introduced to the king by Mazarin, and found a powerful friend in Colbert, to whom he was indebted for his appointment as the king's first painter, as well as for letters of nobility. These honours were conferred upon him in 1662. To the same minister he owed his appointment to the general direction of all the royal works. He was afterwards placed at the head of the academy of painting, which he greatly served, by his successful exertions, to procure the establishment of a new school at Rome, in which young artists, selected from his countrymen, might be gratuitously educated. In his old age, however, Le Brun experienced mortifications arising from causes not necessarily implied in age. Colbert was removed from the superintendence of the royal edifices. Louvois succeeded to the department, and it was natural that the new superintendant's enmity to Colbert should embrace all his favourites. If the king was not to be influenced so far as to withdraw his countenance from Le Brun, yet it was easy to torment a man of his character, by giving him a rival at the palace, in the person of Mignard, and by pointing the competition with all the vexations of a little and contemptible malice. Le Brun was not of a temperament to regard these

attempts upon his quiet with philosophical indifference, or with cool disdain. They shook his tranquillity, and are thought to have hastened his dissolution: he died of a decline in 1690, in the 71st year of his age. Extreme jealousy of competition seems indeed to have been the great shade in his character, unless the imputation may be thought to have arisen not so much from an excess of jealousy in him beyond other professors of his art, as from his more unreserved expression of what he felt. Had he judged it necessary or decorous to make a secret of his feeling of jealousy, he would doubtless have suppressed the expression of satisfaction, after his visit to another and a formidable rival, Le Sueur, in his last illness, on which occasion he was heard to say, that death was going to take a great thorn out of his foot. The discredited report that he had procured his rival's death, by poison, is a proof, both of the prevailing opinion of his jealousy, and of the scandalous illiberality of his enemies. The merit of Le Brun, as a painter, was such, that few have had less cause for apprehension from competition. His genius, and the course of his studies, engaged him in lofty designs, in the execution of which, the historical propriety, good ordonnance, and just expression, are particularly admired. As a colourist, he is entitled to less praise; and in drapery and ornament, by departing from simplicity, he has betrayed considerable deficiency of taste. As a writer, he is well known by his two works, one on physiognomy, and the other on the passions, the latter of which contained figures, which have been much used as models for drawing. It is mentioned, in proof of his solicitude to unite correctness of execution with grandeur of design, that his figures were all drawn naked, and afterwards clothed; and it is related of him, that when he was employed about his great work, the battles of Alexander, he obtained models of Persian horses, drawn for the purpose at Aleppo. The other most celebrated productions of his pencil are, St John in the isle of Patmos, the carrying of the cross, the crucifixion, and the penitent magdalen. He has gained less reputation by his paintings in the great gallery at Versailles, which occupied him during fifteen years of his life, and in which he has exhibited, in allegory, the great events of the reign of Louis XIV. In this work the artist was instructed and trammelled by the courtier; and, if to say, *materiam superat opus*, is but restricted praise, it is all that could be required, in a labour that was rather imposed by interest than chosen by the judgment. See D'Argenville *Vies des Peintres*. (J. M.)

BRUNN, BRINN, BRIUN, BRNO, or *Bruna*, is a city of Moravia, and the capital of a circle of the same name. This town is agreeably and strongly situated, at the confluence of the rivers Schwartzschaw and Surtawa, upon two mountains, the sides of which are well cultivated, and covered with vines. The town is long, and well built, and is remarkable for the beauty of its churches and public edifices. The principal of these is the palace of Dietrichstein; the fine church of the Jesuits; the convent of St Thomas, where there is a miraculous

Madonna, pretended to have been painted by the Evangelist Luke; and the castle of Spielberg, which is built on an eminence near the town, and forms its principal defence. This castle is used also as a state prison, and if it were not a little commanded by the higher ground, it would be one of the finest fortresses in Europe. At the foot of the fortress stands two cloisters of nuns, and an hospital of the Knights of Malta. The Carthusian monastery of Konigsfeld is very near the city; and half way between Brunn and Rischaw, there is a monument of marble erected in honour of one of the emperors. The bas reliefs in bronze, represent him as conducting the plough. There are four fairs held annually at Brunn; and the principal articles of manufacture are silk stuffs, cloth, velvets, and hats. Speaking of the fortifications of Brunn, the celebrated Guibert observes, "N'a qu'une enceinte, avec quelques ouvrages extérieurs, médiocrement entretenus; seroit susceptible de devenir une bonne place, mais ne defend aucun débouché, le pays étant tout ouvert autour d'elle."* Brunn is the seat of several tribunals, and the diets of the state are held at Olmutz and at Brunn alternately. There is a fine quarry of marble in the vicinity of the town. Population 16,000. East Long. 16° 30'. North Lat. 49° 9'. (j)

BRUNSVIGIA, a genus of plants of the class Hexandria, and order Monogynia. See *BOTANY*, p. 187.

BRUNSWICK, a city of the kingdom of Westphalia, and capital of the department of the Ocker, is situated in a very agreeable plain on the banks of the Ocker, which is navigable above the city as far as Wolfenbüttele. It was formerly an imperial city, and one of the richest and most powerful of the Hanstowns: It maintained its liberty during many severe and tedious contests, until 1671, when it was subjugated by Rodolphus Augustus, Duke of Brunswick Wolfenbüttele, who erected a citadel in the town to secure its subjection; and, from that time, it continued to be the residence of the reigning prince, until its annexation to the kingdom of Westphalia. The town has the form of nearly a square. It is strongly fortified, and extends about two miles in circumference. On the ramparts is a brass mortar, 10½ feet long, and above 3 feet in diameter. It weighs 1800 quintals, and requires 52lb. of powder for a charge; and can throw a ball of 730lbs. weight to the distance of 33,000 toises. The houses are in general old, and built of wood; but the city has lately received considerable additions, and is daily acquiring fresh beauty. The principal public buildings are, the duke's palace, which contains a superb collection of natural history, of prints and pictures, and in the library are a number of scarce and curious bibles, and fragments of bibles, in various languages, amounting to nearly 1000 volumes; the cathedral, which contains the tombs of Duke Henry the Lion, and of several emperors and princes of the house of Guelf; the churches of St Nicholas, St Catherine, and St Andrew; the academy for martial exercises, where the students are instructed in every branch of science connected with military tactics; the armoury; the council-house; Caroline college, erected by duke Charles in 1745; two gymnasiums, with a school for anatomy and surgery; and

a college for the study of physic, instituted in 1757. It has also an orphan house, a large lazaretto, and an hospital. After Brunswick ceased to be a free, and became a fortified city, its commerce began to decline, and its population to diminish. The interruptions of trade, occasioned by frequent wars, and the insolvency of its garrison, soon drove many of its tradesmen to settle in the other free cities of Germany. About the middle of the last century, however, this city was again plentifully replenished with French refugees, who had been driven from their country by popish intolerance, and sought in Brunswick the freedom of religious worship. These were greatly encouraged by the reigning duke, who granted them considerable privileges and immunities; and, under their direction, were established many valuable manufactures of woollen cloths, such as serges, barracans, flannels, rutteens, and camlets. Besides these, Brunswick has manufactures of silk, linen, steel, iron, paper, snuff, earthen ware, and varnish, also bleaching yards for linen, and extensive breweries. Its manufacture of printed calicoes is one of the most flourishing, and the first of the kind in Germany, and its preparations of red alum, and sal ammoniac, are of a very superior quality. Strong beer, called *mum*, from the name of the inventor, Christian Mummer, is exported to various parts of Europe, and even to India; and many tons of succory root, prepared as coffee, are annually sent to Lubeck, and from thence exported to Sweden and Russia.

In this city, many hundreds are employed in spinning wool and flax, and the invention of spinning wheels is ascribed to a statuary of Brunswick, called Jurgen, in 1530. They are furnished with the materials from the work-house, which was established for the purpose of providing employment for the poor, and are paid for their labour on the same terms as those employed by the manufacturer. Grown up persons perform this work at their own homes; but 200 children are daily employed in the house, where they are also instructed in reading and writing. The commerce of Brunswick is now very considerable, both in natural and artificial productions, as well as in foreign merchandise. Its fairs are crowded with strangers, from all the principal cities of Germany, who bring from Hamburg the manufactures of England, with calicoes, velvets, silk ribbons, tresses, and point work of gold and silver; from Bremen and Lubeck various kinds of tanned leather, tallow, oil, wine, and foreign merchandise; linens from Silesia; from Leipsick and Saxony the productions of Italy, Switzerland and France; and from Berlin, Nuremberg, Augsburg, &c. the manufactures of their respective cities, which they either sell or exchange for other commodities. There is always a great traffic here for yarn and flax; and immense quantities of green thread are exported every year to Holland, which is bleached at Haerlem. During the fair the duties are very moderate, and many foreign merchants compound for a certain sum, by which means they are not obliged to disclose the amount of their sales, which is otherwise the only method of determining the duty. The two great fairs continue 18 days each, and begin, the one on the Sunday after Candlemas, and the other on the Sunday after St Laurence-day. Population 31,700. N. Lat. 52° 25'. E. Long. 10° 46'. See Peuchet *Dictionnaire*, &c. and Tynna *Almanach du Commerce*, 1811. (f)

* *Journal d'un Voyage en Allemagne*, tom. ii. p. 110.

BRUNSWICK, New, one of the four British provinces in North America, is bounded on the southeast by the Bay of Fundi, on the south by New England, on the north and west by Canada, and on the east by the Gulf of St Lawrence. The principal towns of this province are Frederickstown the capital, St Ann's, St Andrew's, and St John's; and it is watered by the rivers St John's, Magegadavick, or Eastern River, Dickwasset, St Croix, Merrimichi, Petitcodiac, Memramcook; all of which, excepting the three last, discharge themselves into Passamaquoddy Bay. In the St John's River the tides flow about 80 miles; and it is navigable for vessels of 50 tons about 60 miles, and for boats about 200 miles. The vast extent of country into which it opens, contains rich vales and cultivated meadows, while the higher grounds are generally covered with wood.

After the settlement of this province by the American loyalists in 1783, the inhabitants eagerly engaged in endeavouring to supply, with fish and lumber, the British possessions in the West Indies; and within the first ten years, they had built 93 square rigged vessels, and 71 sloops and schooners, which were principally employed in that trade. In the year 1793, however, this trade was greatly injured by the permission granted by proclamation to the United States of America, to supply the West India islands with every thing they wanted. The citizens of the United States being exempt from a duty of $2\frac{1}{2}$ to 5 per cent. exacted in the West India islands from British subjects, and not being subject to the high rates of insurance on their vessels and cargoes, nor to the great advance in the wages of seamen, with which the inhabitants of New Brunswick had to struggle, were obviously enabled to engross a great part of the trade of that province. The American government, by granting a bounty of nearly 20 shillings per ton on all vessels employed in the cod-fishery, have now engrossed the principal part of the cod fishery in the bay of Fundi; and from the county of Charlotte, which is separated only from the United States by a navigable river, have been enabled to carry off annually, and to reship for the American market nearly three millions of feet of boards, cut in that part of New Brunswick, and also a large proportion of the fish, caught and cured by British subjects, in the bay of Passamaquoddy.

The sea-coast of New Brunswick abounds with cod and scale fish, and immense shoals of herring, shad, and salmon annually enter its rivers. The herrings are possessed of a greater degree of firmness than the common herrings, and are capable of being kept longer in a warm climate. They are caught in such abundance, that the quantity cured is limited only by the insufficient number of hands employed. The numerous harbours along the coast are conveniently situated for the cod-fishery, which may be carried on to any extent. Near the margin of the numerous rivers, creeks, and lakes, which intersect the province, the country is for the most part covered with inexhaustible forests, of pine, spruce, birch, maple, elm, fir, and other timber, proper for masts of any size, lumber, and ship-building. The smaller rivers afford excellent situations for saw mills; and from the melting of the snow in spring, every stream is rendered sufficiently deep to float down the masts and lumber of every description, which the inhabitants have cut and brought to its banks during the

long and severe winters, when their agricultural pursuits are suspended.

In the interior of the province, the lands are generally excellent; and where they have been cultivated, they have proved very productive, owing to the small number of the inhabitants. Great advances have not yet been made in agriculture; but within a few years preceding 1804, there has remained, beyond the domestic supply, a considerable surplus in horses, salted provisions, and butter for exportation. The following table exhibits the trade of New Brunswick during the last seven years:

	Ships cleared out.	Tons.
1804 . . .	126 . . .	17.203
1805 . . .	119 . . .	15.910
1806 . . .	128 . . .	20.019
1807 . . .	156 . . .	27.430
1808 . . .	253 . . .	39.114
1809 . . .	310 . . .	55.158
1810 . . .	410 . . .	87.690

(*)
BRUSSELS, or **BRUXELLES**, a city of France, formerly the capital of Brabant, and of the Austrian Netherlands, now the chief place of the prefecture of the department of the Dyle, is situated on the river Senne, in a fertile and picturesque country, about 27 miles S. of Antwerp, with which it communicates by a canal, and 177 N. by E. of Paris. It is a rich, handsome, and populous city, rising from the river to an eminence on the east, and unites the magnificence of Paris with the cleanness of a Dutch town. Brussels is encompassed by a double brick wall, with seven gates, and about seven miles in circumference; and without the walls contains seven parishes, Ste. Gudule, Notre Dame de la Chapelle, St Geri, St Nicholas, Ste. Catherine, St Jaques de Caubergue, and Notre Dame de Finis-terræ. It is surrounded with extensive suburbs, consisting of several villages, and joined to the city by a continuity of streets and buildings. The city is divided into eight sections. The older and lower streets are small and crooked, but the more modern ones are straight and wide. The houses are lofty and well built, and its public structures display both taste and magnificence. The ducal palace, where the governor used to reside, stands upon an eminence, with a large square before it, encircled with pillars of brass, on which are statues of several emperors and dukes of Brabant, as large as life. It was begun in 1300, by John II., duke of Brabant, and finished by the successors of Philip the Good in 1521. It then contained one of the most beautiful chapels in Europe, which was pulled down in 1777, to make room for the new square called Place Royale. This superb building is now converted into a central school for the department of the Dyle, to which is attached a public library, a botanical garden, and a collection of paintings. The school is divided into three classes. In the first are taught, drawing, natural history, and the Greek and Roman classics; in the second, mathematics, physics, and chemistry; and in the third, universal grammar, the fine arts, history, and jurisprudence. The library was collected from the Belgic emigrants, and the libraries of the suppressed cloisters. It contains about 120,000 volumes, and some valuable MSS. Behind the palace, at the extremity of an extensive and beautiful park, well stocked with deer,

stood a pleasure-house, built by order of Charles V., and where he resided six months previous to his abdicating the imperial throne. This fine park was nearly destroyed by the French soldiery and the Belgic sans-culottes, and would have been totally laid waste, had not the French general interposed, and prevented its total destruction. It has, however, been restored to its former beauty by the municipality of Brussels, at their own expence. In the great market-place, which is the most beautiful in the world, is the Hotel de Ville, begun in 1380, and finished in 1442. The building is Gothic, and has a most magnificent appearance. Its turret is an admirable piece of Gothic architecture, 364 feet in height, and surmounted by a statue of St Michael with the dragon, in copper gilt, 17 feet high. This statue turns upon a pivot, and acts as a vane. In one of the apartments of the Hotel de Ville were formerly held the meetings of the states of Brabant. It is handsomely ornamented; and in three other rooms is the history of the resignation of Charles V., so beautifully wrought in tapestry, that it may be mistaken for painting. This edifice is now appropriated to different tribunals, and one of the wings is converted into a prison. The church of Ste. Gudule is a very magnificent structure, situated in a high part of the city, and approached by a flight of steps. It contains no less than sixteen chapels, all of which are decorated with some very capital paintings. The chapel of Notre Dame is also a beautiful old building; and the church of the capuchins is the finest which that order possesses in Europe. But since the last conquest of Belgium, nearly one third of the churches have been shut up, and despoiled of their plate and pictures. Besides these, there are many palaces belonging to the nobility, in which are some of the most valuable paintings, by the best Flemish masters. Brussels has also 20 public fountains, embellished with statues, one of which is a child in brass, so admirably executed, that it has excited the notice of the first connoisseurs. The hospitals are well endowed, among which are a foundling hospital, and one for penitent courtizans; and also an hospital where strangers were maintained free of expence for three days. Brussels had once an imperial and royal academy of sciences and belles lettres, which was instituted by letters patent, the 16th of December 1772, and whose memoirs from 1777 to 1788, are published in 5 vols. 4to; but, "like all other antient institutions," says a French writer, this society exists no longer.

The manufactures of this city have always held a distinguished place in the trade of Europe. Its laces and carpets have seldom been equalled, and never surpassed; and though of late years, many of its workmen have been dragged from their homes, to supply the waste of the French armies, yet these manufactures are still carried on to a considerable extent. All kinds of cotton and woollen stuffs are made here. Its camlets are superior, both in beauty and quality, to those of Leyden and England; and its silk stockings equal in fineness those of Paris, and, as they use only the silk of Piedmont, are far superior in quality. They manufacture also gold and silver lace, which can scarcely be distinguished from the finest of Lyons and Paris. Great quantities of this article are sent to India, and to every part of Europe; and the Brussels merchants have greatly the advantage over all their competitors, since labour is here much cheaper, and since they are allowed, as an

encouragement to industry, to export it free of duty. The considerable drawback, however, upon this manufacture is, that they must bring all their gold and silver wire from Paris, Amsterdam, and Lyons. It has, besides, several manufactories of potash; and its earthen ware is said to be even preferable to that of Delft or Rouen. But though Brussels may still surpass many of the cities of Europe in the beauty and quality of some of its manufactures, yet it has greatly fallen from its former eminence as a commercial city, and retains very little of that activity which characterised it while under the dominion of the Dukes of Brabant and the house of Austria. Its fair, which is held annually on the 8th of October, has now lost its most regular and wealthy visitors, the merchants of England; and the blockade of the Scheldt, greatly hinders its communication with the eastern and western continents.

In 1321, the citizens of Brussels were divided into nine classes, called nations, who were formed of the principal artisans of the city. They are distinguished by the names of Notre Dame, St Giles, St Laurent, St Geri, St Jean, St Christophre, St Jaques, St Pierre, and St Nicholas, each nation having a chief or dean, with his assistant council. They were assembled by a bell, called the bell of the nations, to signify their consent, in the name of the city, to any subsidy demanded by the sovereign, or to any proposition of the burgomaster.

Besides the governor-general and council, the magistracy of Brussels formerly consisted of an amman, a burgomaster, seven echevins, two treasurers, a pensionary, three secretaries, three gressiers, and two receivers. These were elected by the governor from the descendants of seven patrician families, who according to Puteanus, a famous historian of the country, were anciently the lords of Brussels, viz. the families of Steenweghe, Sleeuws, Serhuyghs, Coudenberg, Serrælofs, Sweerts, and Rodenbeeck. It had also a deputy amman, an under burgomaster, nine counsellors chosen from the citizens, a superintendant of the canal, a receiver for the canal, and a gressier of the treasury. The second burgomaster, the counsellors, and the receivers, were named by the first burgomasters; and the offices of ammans, secretaries, and gressiers of the treasury, were perpetual. All matters relative to the citizens were cognizable before the magistracy, with the right of appeal to the superior council. Since its annexation to France, however, this form of government has been abolished. It has now a prefect, a secretary-general, a receiver-general, a payer of the public treasure, and a director of the customs. It is the imperial court for the departments of Jemappes, the Two Nethe, the Dyle, the Scheldt, and the Lys. It has also a court of criminal and special justice, with a chamber and tribunal of commerce.

The city of Brussels owes its origin to St Gery, bishop of Cambray, who, in the beginning of the 7th century, built a chapel in a small island, formed by two branches of the Senne, and preached the gospel to the neighbouring peasants. Attracted by the pleasantness of the situation, and the piety of the venerable bishop, the peasants flocked from the surrounding country, and numerous huts soon arose along the banks of the river. These, in a short time, increased to a considerable village, to which they gave the name of Brussel, *hermitage-bridge*, and so early as the year 900, it had both a market and a castle. In 1044, it was first enclosed with a wall, and fortified with towers, of which some vestiges

are still remaining; and, in 1379, it was greatly enlarged and walled round, in the manner in which it now appears. It became the residence of the Dukes of Brabant, and afterwards of the Austrian governors, who kept their court here with all the honours of a sovereign prince; and during the usurpation of Cromwell, this city was also the occasional residence of Charles II. of England, and his brother the Duke of York.

In 1695, it was bombarded by Marshal Villeroi, who advanced towards Brussels in hopes of compelling the allies to raise the siege of Namur, and poured in such a quantity of bombs and red-hot balls, that the city took fire, in which 4000 houses, and 14 beautiful churches, were consumed. After the battle of Ramillies, it was abandoned by the friends of Philip V. and the keys of the city were presented to the Duke of Marlborough, who took possession of it in the name of Charles III. King of Spain. It was again besieged in 1708, by Maximilian Emanuel, Elector of Bavaria, who, after having been repulsed, was compelled to retire by the approach of the Duke of Marlborough. Marshal Saxe took Brussels in 1746, but it was restored at the peace of Aix-la-Chapelle, and continued under the Austrian government until the revolutionary war, when Dumourier entered it on the 14th of November 1792, soon after the battle of Jemappe. He, however, quitted it to the Austrians on the 23d of March in the following year, and left no traces of his hostile visit, except the universal defacing of the imperial ensigns. The French regained complete possession in the summer of 1794, and at the peace it was annexed to France. Population, 75,000; or, according to Tineau's Statistical View of France, 66,279. E. Long. 4° 26', N. Lat. 50° 51'. See Bygge's *Travels in the French Republic*, p. 51; Trotter's *Memoirs of Mr Fox*, p. 110, 153; Shaw's *Sketches of the History of the Netherlands*; Holcroft's *Travels from Hamburgh to Paris*; Peuchet *Dictionnaire*, &c.; and Tynna *Almanach du Commerce*, 1811. (p)

BRUTE is a name given, in common language, to all those classes of living creatures which are conceived to be destitute of reason, and particularly the beasts of the field. It is evidently derived from the Greek *βρω* (whence *βρωσις*), to feed, which may be traced to the Hebrew *בָּרַע*, or to *בָּרַח*, (whence *בָּרוּת*, food,) these animals having always been noted for their voracious tendency, *prona et ventri obedientia*.

In treating the article ANIMAL, we shortly adverted to the speculations of philosophers concerning the disputed boundaries between the imperfect modification of life peculiar to vegetables, and the higher principle of animation inherent in sensitive beings. The object of the following remarks is, by comparing the chief resemblances and diversities observable among the rational and irrational tribes, to ascertain the characteristic features of distinction which mark the degradation of the brutish below the intelligent nature.

On this point, two leading opinions have been maintained;—the one, that the capacities of brutes differ from those of man in degree only; the other, that they differ not merely in degree, but also in kind.

In some particulars, the faculties of the lower animals appear to be at least equal to the human. Many of them give proofs of the most acute sensibility in their perceptive organs, while, at the same time, they possess abilities for active exertion, which set the strength and patience of man at defiance. But these advantages can be claimed by a very limited proportion of the less perfect

animals; and upon the whole, the pre-eminence of our race is such as scarcely to admit of a comparison with the other inhabitants of this globe.

Even this inconsiderable superiority of certain animals, in respect of hardness, agility, muscular power, and organic acuteness, is much less discernible when we view man in that condition which is the least removed from that of brutes. The savage pursues a mode of life, which, though it exposes him to unceasing peril, brings all his corporeal powers into action; and, however little he may be indebted to the co-operation of his fellows, or to the adventitious benefits resulting from civilized life, he is able, under the most unfavourable combinations of circumstances, to assert his supremacy over all the families of birds and beasts which people his native woods, not only in consequence of the ascendancy of his reason, but even in the application of dexterity, force, and cunning; the only weapons which his winged and quadruped rivals are capable of wielding.

The brutes appear to be guided almost entirely by appetite and instinct. The gratification of their senses, if not the primary law of their existence, is at least the object which seems perpetually to occupy them. When they are left to themselves, this desire of sensitive indulgence rarely proceeds beyond the bounds which are consistent with the preservation of the individual, or the propagation of the species.—And whenever these ends are promoted by means which are not evidently subservient to enjoyment, or which presuppose an intuitive sagacity not referable either to sense or to reason, we ascribe the result to instinct. It is possible, however, and, indeed, it is highly probable, that in most, if not in all, the cases of what we denominate instinct, the animal is incited by sensation, or appetitive orgasm, as much as when we can discern the impulse by which it is actuated. And there seems to be great reason to suspect, not only that the senses of some animals are finer than ours, but even that they possess additional senses, enabling them to discover certain qualities of alimentary substances, and certain changes in the state of the atmosphere, which are not discernible by human organs.

But though, in a state of nature, all the actions of brute animals may, in general, be referred to instinctive impulse and sensual desire, they are evidently capable of profiting by experience, and of being moulded by tuition, so as to exercise powers which they never acquire in any degree of proficiency, till they become the subjects of instruction. Whether we consider them as learning by their own observation, or as being trained by discipline, we must allow that they are possessed of certain faculties analogous to those powers which render man susceptible of education. They could not be taught any of those feats which are sometimes exhibited, unless they retained in the memory the impressions made on their senses, and unless they were actuated by motives to exercise volition, or to submit to authority. Innumerable instances might be produced, of the tenacity with which they preserve trains of ideas, and of the facility and accuracy with which they can retrace a series of objects, even in an inverted order; as when a dog or a horse returns by a way along which he has passed only once, and at a distance of time which precludes the supposition of his being guided by the smell. A horse will, at the distance of many years, remember the precise spot where he has been frightened, though no vestige of the terrific object should remain. We have no

certain means of determining how far Aristotle's assertion is correct, that brutes are destitute of the power of reminiscence, or the voluntary effort to recover what has escaped the recollection. Dr Reid's opinion, that they cannot measure time as men do, by days, months, or years, and that they have no distinct knowledge of the interval between things which they remember, must be received with some limitation. In some pastoral districts of this country, where the dogs are accustomed to follow their owners to church, it is a well attested fact, that some dogs have formed the habit of going every Sunday, even when divine service was not performed, and when, from the uniformity of the occupations going on in such scenes every day of the week, it is difficult to perceive what particular association could have influenced them, unless they had acquired the capacity of numbering the days of the week. But if brutes do possess this faculty, it is probably in a very imperfect degree; and we would require stronger testimony than that of Montaigne, to induce us to credit the story of the arithmetical oxen at Susa, every one of which, being in the daily practice of turning an hundred rounds of a wheel for drawing water, was so accustomed to this number, that no force could prevail on him to proceed beyond it. The thing will not, however, appear altogether inconceivable to those who have had opportunities of perceiving how well the most unwieldy animals, such as elephants, camels, and bears, may be taught to dance, and how many notes of a tune some birds can learn in a very short time;—facts which render it probable, that these creatures may, to a certain extent, form measures of duration, and acquire the ideas of number.

It is commonly supposed that brutes are void of imagination. How then are we to account for those appearances during their sleep, which seem to indicate dreaming?

Quippe videbis equos fortes, cum membra jacebunt
Id somnis, sudare tamen, spirareque sæpe,
Et quasi de palma summas contendere vires,
Venantumque canes in molli sæpe quiete
Jactant crura; tamen subito, vocesque repente
Mittunt, et crebras reducunt naribus auras,
Ut vestigia si teneant inventa ferarum, &c.

LUCR. l. iv.

The dreams of these animals, however, may be of such a kind, as not necessarily to imply the exercise of imagination; and probably they may be excited by some of the simpler processes of the association of ideas. They at least presuppose a faculty of conception.

Whether any of the inferior tribes of animals are capable of reasoning or not, has long been a subject of dispute. Most of the ancients admitted that the brutes possess this power; and it has sometimes been said, that the most familiar facts with regard to their docility, are specimens of ratiocination, or of deducing conclusions from the comparison of different ideas. When, for instance, a dog is taught to dance or tumble, he must be allured to obedience, and chastised for inattention. His choice, therefore, is supposed to be determined by such considerations as these: "If I obey, I shall be caressed and fed; if I disobey, I shall be beaten and starved. It is therefore better for me to obey." It is a simpler and more satisfactory account of this matter, to say, that obedience is associated with an idea of pleasure, and that neglect, or disobedience, is inseparably combined with the idea of pain; or, in other words, that hope and fear unite their influence with such

force as to supersede the necessity of logical deduction. But there is certainly a degree of reason displayed by some of the more sagacious brutes, in pursuing a series of means, with a view to attain some desirable end, and in varying the means employed, according to circumstances. None of them, however, give any unambiguous proofs of a capacity to investigate truth by a procedure similar to the reasoning, or induction, by which the human mind presses forward to discovery. Mr Locke ascribes this defect to their inability of "abstracting or making general ideas." They can reason only in particular ideas, (according to his opinion,) and they have no use of any general signs for expressing universal ideas; nor is this owing to the inaptitude of their organs for framing articulate sounds, Many of them can be taught to utter such sounds, but never to apply words with intelligence; and in this incapacity of generalising and of communicating their thoughts by artificial signs, Mr Locke conceives the specific discrimination between them and the human race to consist.

Whatever disadvantages appear to be involved in the want or imperfection of the rational nature, are abundantly compensated by the substitution of instincts adapted to the situation of every animal. This wise provision supplies the absence of reason, by accommodating the constitution of all sentient creatures to the laws of matter, and to the several destinations assigned to the different tribes. Some instincts may be described as universal, and as being common to man and other animals, such as the actions of respiration, suction, and swallowing. Others are peculiar to each race of creatures. Unlike the processes of reason, they operate with unvarying uniformity in all the individuals of the species, and they attain their ends with absolute infallibility. Plutarch and some other writers have affirmed, that many of the arts practised by human beings were originally suggested by observations of the instinctive manufactures of other animals. Mr Pope, borrowing this idea from Pliny, has amplified and embellished it with the charms of his inimitable muse, in the third Epistle of the *Essay on Man*, (v. 169, seq.)

See him from Nature rising slow to Art!
To copy Instinct then was Reason's part;
Thus then to man the voice of Nature spake—
"Go, from the creatures thy instructions take:
Learn from the birds what food the thickets yield;
Learn from the beasts the physic of the field;
Thy arts of building from the bee receive;
Learn of the mole to plow, the worm to weave;
Learn of the little nautilus to sail,
Spread the thin oar, and catch the driving gale.
Here too all forms of social union find,
And hence let Reason, late, instruct mankind.
Here subterranean works and cities see:
There towns aerial on the waving tree." &c.

We are far from subscribing to this fanciful opinion, which ascribes the origin of the arts to the imitation of blind instincts; but we must admit, that mankind, in the ruder states of society, have in general attended with great respect to the operations of the brute creation, and have imagined that they were indebted to them for many essential advantages. It appears to have been from a conviction of the superior sagacity of some of these creatures, that the art of augury took its rise; and many of the examples of brutal intelligence recorded by Cicero, in his 2d Book *De Nat. Deorum*, &c., appeared to have been noted chiefly as arguments for the practice

of divination. Hence, too, as was remarked by one of the ancients, "*Belluæ a Barbaris propter beneficium consecratæ.*" Hence the absurdities of the Egyptian superstition, in deifying bulls and cats, crocodiles and serpents:

——— Crocodilon adorat
 Pars hæc, illa pavet saturam serpentibus Ibin;
 Effigies sacri hic nitet aurea Cercopitheci,
 Dimidio magicæ resonant ubi Memnone chordæ.
 Illic cæruleos, hic pisces fluminis, illic
 Oppida tota canem venerantur, nemo Dianam.

Jov. Sat. 15.

We may remark, farther, concerning the instincts of the inferior animals, that one of the leading distinctions between man and them, consists in his capacity of learning lessons, not only from the experience of his own species, but from attending to the economy of other tribes; whereas these creatures appear to gain no advantages from their observation of the labours of man, or from considering the ways of any other creature.

It would appear, also, that though the generality of animals are capable of being taught several things in addition to those which instinct prompts them to perform, none of them ever improves upon the native instincts peculiar to the species; and whatever diversity of ability they may exhibit in other respects, none of them is more accomplished than the rest, in the practices which Nature has taught his race. It is manifest, likewise, that the proficiency which any individual of a species may have attained by instruction is of no avail to his posterity. He has no means of recording his experience, or of transmitting any of his acquisitions to future generations. The only signs which he knows how to apply, are such as express emotions universally intelligible, and being incapable of forming and interpreting arbitrary signs, he can convey no ideas except those which are already familiar to his associates.

From these premises, it is not to be concluded, as Des Cartes and Malebranche have done, that brutes are neither more nor less than machines, *qui mangent sans plaisir, crient sans douleur, ne desirant rien, et ne craignent rien.* Nor, on the other hand, can we admit the doctrine of Helvetius, that the superiority of man must be referred entirely to corporeal organisation, and to the operation of certain adventitious circumstances in his outward condition. Both these opinions have a tendency to degrade the human nature; for if, on the former supposition, the actions of brutes are explicable by principles of mere mechanism, it will not be easy to shew, that human beings are not also machines, seeing we must ascribe similar effects to similar causes; and if the whole difference between the mental faculties of man and the capacities of beasts, be the result of peculiarities in organic structure, and accidental advantages, here, too, we are reduced to the necessity of adopting a system of materialism. Both these doctrines, indeed, are purely hypothetical, and unsupported even by the evidence of probability. We may grant, however, that the conformation of the human body is peculiarly adapted for the exertions of intelligence and will, and in particular, that the distributions of the nerves and muscles of the hand, the eye, the ear, and the vocal organs, confer advantages on man, which raise him greatly above the rank of the other animals. It must also be allowed, that some accidental discoveries have contributed greatly to advance

the arts, and to confirm the supremacy of man;—and among the physical advantages to which he is indebted, it is not the least conspicuous, that, from his power of subsisting on various kinds of food, and sustaining the extremes of heat and cold, he can accommodate himself to every climate on the face of the earth. But these circumstances are not, of themselves, sufficient to establish his claim to superiority, or to qualify him for the dignified place which he occupies in the scale of existence.—He is informed by a nobler spirit, "which teacheth him more than the beasts of the earth, and maketh him wiser than the fowls of heaven."

Hitherto we have taken notice only of those particulars in the constitution of brutes, which remind us of the operations of intelligence, and the labours of ingenuity. It might perhaps be thought that they approach nearer to man in affection than in understanding; but the symptoms of their attachment to one another are generally of a very different character from the indications of human kindness. The *otryx* of the dam for her brood operates only so long as they require her assistance and protection,—and from the moment when they become independent, we see the creature which fostered her young so tenderly, and sheltered them so vigilantly under the covert of her wings, "hardening herself against them as though they were not hers." How different from that maternal fondness in the human species, which no lapse of time can ever detach from those who were once caressed as babes and sucklings! The most permanent attachments of other animals appear to be those which are acquired. Some of them are highly susceptible of gratitude; and we would not easily give credit to an account of a dog deserting a master by whom he had been affectionately treated, however great the extremity of danger by which he might be threatened. A sense of shame, and a spirit of emulation, are likewise deeply rooted in some of them; and that they are subject to jealousy, has been affirmed by many authors. "*Animalia* (says Lud. Vives.) *quædam zelotypia tanguntur, ut olores, columbæ, galli, tauri, ob metum communione.*" Every one who attends to the domestic animals must have observed proofs of resentment and envy when there is any appearance of too liberal a share of partiality being bestowed on a new favourite. With the exception of beasts of prey in their natural state, all animals are eminently social; and some of them are capable of combining in great bodies for the accomplishment of ends which could not be attained in a state of separation. The beaver and the bee are the most remarkable instances of such a union; but, in addition to these instinctive associations, we observe attachments taking place occasionally among creatures of very dissimilar characters and habits. There appears, however, to be no evidence that brutes are actuated by any moral impressions, or that they can discern between what is good and evil in conduct. They may be incited by hope, or deterred by the apprehension of punishment—they may be depressed by disappointment and sorrow, or elevated by gladness, as in the case of recognising an acquaintance after a considerable period of absence. They express these feelings by sounds which are intelligible, but only to their own species; and they seem to understand the various notes of sadness, threatening, displeasure, commiseration, and endearment, uttered by man and by other creatures. They seem frequently to be moved with sympathy; and though there is perhaps more fancy than nature in Virgil's de-

scription, it is certain that some animals are capable of mourning the death of men :

Post bellator equus, positus insignibus, Æthon,
It lacrymans, guttisq; humectat grandibus ora.

ÆN. xi.

Upon the whole, however, we may conclude, that the difference between the human and the brutal constitution, is a difference of kind as well as of degree. See *Aristot.*; *Æliani Hist. Animal.* C. *Plin. De Animal.* &c. (λ)

BRUTON, or **BREWTON**, the name of a market town in the county of Somerset, situated near the head of the river Brew, over which there is a stone bridge. The town is pleasantly situated and well built. It consists chiefly of three streets, in the centre of which is the market-place. In the high-street is the market-house, which was built by a subscription of the farmers who frequented the town. Over the market-house is a spacious hall, in which the quarter sessions for the eastern division of the county are sometimes held. The church is a handsome building, and has two quadrangular towers, one at the north, and the other at the west aisle. There is also a free school at Bruton, founded by Edward IV., and a noble alms-house, endowed by Hugh Saxey, Esq. auditor to Queen Elizabeth. Its annual income is about 2500*l*. The old hexagonal market-cross, which was lately removed, was supported by six pillars at the angles, and a large one in the centre. It was 18 feet high, and was built by John Ely, the last abbot of Bruton. The only manufactures of the town are, a small one of stockings and inferior kinds of woollen goods, and another of sàk throwing, which is performed by machinery. Number of houses 333. Population in 1801, 1631, of whom 180 were returned as employed in trade and manufactures. See *Maton's Tour through the Western Counties*, vol. ii.; and *Collinson's History of Somersetshire*, vol. i. (π)

BRUTUS, **LUCIUS JUNIUS**, was a son of Marcus Junius and Tarquinia, daughter of Tarquin the Proud. His name was held in great veneration by the Romans, who regarded him as the author of their liberties, and founder of the Roman republic; and, as commonly happens, this veneration, aided by antiquity, has caused too much of the marvellous to be admitted into his history. Livy informs us, that Brutus, having seen the chiefs of the city, and among them his brother, cut off by the tyrant, resolved to save himself if possible from the jealousy of Tarquin, by allowing his property to be alienated without opposition, and by assuming such a character of stupidity, and even fatuity, as gained him the name of Brutus among his countrymen. Notwithstanding when Tarquin, alarmed at the portent of a serpent in the palace, resolved to send confidential messengers to consult the oracle at Delphos, Brutus was chosen to accompany two of his sons on an errand which was held of the greatest import, and in a voyage which must have appeared at that time long and critical. It is added, that Brutus, in allusion to his disguise of his true character, made an offer to Apollo of a staff of gold inclosed in a wooden tube; and that when in reply to the enquiry of the Tarquins, "which of them should reign in Rome?" a voice issued from the cave, which declared, "that he should have the supreme authority at Rome who should first salute his mother with a kiss." Brutus, in order to determine the accomplishment of the

oracle upon himself, fell to the earth as if by accident, and saluted that with a kiss. On their return to Rome, they found the king engaged in preparations for making war upon the Rutuli. During the siege of their principal town, Ardea, it happened, that the sons of Tarquin, and others of the royal house, being entertained at the quarters of Sextus Tarquinius, warmly disputed a question which implied little of modern refinement, each maintaining the superior excellency of his own wife. At length it was agreed that the whole party should mount their horses, and surprise the ladies as they might happen to be employed at the time. The result of the trial was, that Lucretia, the wife of Collatinus, was declared to be the most deserving; and, that Sextus Tarquinius, whose passions were inflamed by the virtue which should have awed them, resolved that Lucretia should be their victim. Having, after a short interval, accomplished his villanous design, he left the insulted matron to her shame and her revenge. Having convoked her principal male relations and friends, she first acquainted them with her dishonour, and its author, and then plunged a dagger in her heart. That Brutus should have been present on such an occasion is not easily reconciled with his reputed fatuity, unless his friends might be supposed to be in a secret which yet remained a secret to the rest of the royal family, and to all Rome. Now, however, as if moved by inspiration, he threw off his disguise, and, in an animated strain of eloquence, engaged all who were present to bind themselves with him in a solemn oath to pursue the atrocious offender, and all the family, with fire and sword, and to abolish the regal name in Rome. The body of Lucretia being then removed into the Forum of Constantia, (the town where Collatinus resided,) Brutus reproved the lamentations of the friends of the deceased, and called upon the inhabitants to show themselves men, and Romans, and take arms against the authors of the crime. The youth of the place soon crowded around him in arms. A garrison was appointed to defend the walls, and guard the gates, that none might pass out of them, and carry tidings of what was going on to Tarquin. From Constantia, Brutus, accompanied with a body of men, repaired to Rome, and in an oration of great pathos and force, called upon the people to punish the offenders, and expel the tyrant. The laborious and degrading employments in which Tarquin had long employed many of the citizens, treating them more like slaves than soldiers, furnished him also with a popular and persuasive topic of declamation. Intelligence of these commotions soon reached the camp before Ardea, and summoned Tarquin to Rome. Brutus foreseeing such a step, and prepared to turn it to the advantage of his enterprise, marched from Rome to Ardea by a different route, and arrived in the camp at about the same time that Tarquin appeared before the walls of Rome. The gates of the city were closed against him; and the army before Ardea were, in like manner, engaged to drive his sons out of the camp. Two of them followed their father into Etruria; but Sextus, the perpetrator of the outrage, having repaired to his province, was slain there by the Gabii, who hated him for his former rapine and murders committed among them. The Comitia of Centuries were now assembled at Rome, and two consuls elected, Lucius Junius Brutus, and Lucius Tarquinius Collatinus, 244 years after the founding of the city. One of the first acts of Brutus, according to Livy, was, to engage his colleague, Collatinus, to resign the con-

sulate, and go into voluntary banishment, for which counsel no other reason was alleged, than that he was a Tarquin, and that the people would never think their liberty secure while any one of his family and name was invested with high authority. The advice of Brutus, seconded by Lucretius, Lucretia's father, and enforced by the voice of the principal men of the state, and of the Roman people, had all the force of a command from a power that was not to be resisted, and Collatinus retired to Lavinium. Still, however, there remained in Rome a royal faction, consisting principally of young men who had been the associates of the exiled princes, and whom the manners of a licentious court had ill prepared for submission to the rigorous administration of republican laws. In the number of the disaffected were included the two sons of Brutus, Titus, and Tiberius, whose mother was the sister of the Vitellii, principal partizans of royalty. The conspiracy having been detected, it was necessary that the offenders should suffer the punishment of traitors, and the nature of his office imposed upon Brutus the duty of seeing the sentence carried into effect. In the presence of the consuls, and of the whole city, the conspirators were first scourged, and then beheaded by the axe of the lictors. The father was sunk in the patriot, and the reclamations of nature were not heard in favour of malefactors, who, for the gratification of disorderly passions, would have deliberately sacrificed their father and their country to the fury of an enraged and sanguinary tyrant. Brutus, whose stern and inflexible virtue was beheld with admiration, even by primitive Romans, did not long survive the expulsion of the tyrant. He fell in the battle which was fought on the first invasion of the Tarquins, by the hand of Aruns; one of the king's sons, who fell at the same time beneath the stroke of Brutus. The matrons of Rome honoured the avenger of their honour with a mourning of one entire year. See T. Livii, *Historiarum*, &c.; *Dionysii Halicarnassæ. et Plutarchi Opera.* (J. M.)

BRUTUS, MARCUS JUNIUS. It was believed by many that Julius Cæsar was the father of Brutus, and Cæsar seems to have been of the same opinion. It is certain that he was criminally connected with Servilia, the sister of Cato, and mother of Brutus, about the time of his birth. His father, whether real or nominal, was put to death by Pompey, for his rigorous treatment of the city of Mutina. Marcus was educated in all the learning and philosophy of the times, and applied himself to the study of eloquence with such success, that Cicero has given him a place in his list of noble orators. When the conflicting parties of Pompey and Cæsar made the ultimate appeal to arms, Brutus espoused the cause of Pompey with his characteristic decision, not from partiality to the man, whom till that time he refused to salute in passing, but thinking his designs less dangerous to the integrity of the republic than those of his rival. When he arrived in Macedonia, and entered the camp of Pompey, he was received by that powerful leader with expressions of respect bordering on deference. After the decisive battle of Pharsalia, he escaped from the camp of the conquered, and concealed himself among the reeds in a contiguous marsh, from which, on the return of night, he fled to Larissa. At this place he received a friendly invitation from Cæsar, who received him with open arms. He was appointed by the conqueror to the government of Gallia Cisalpina, of which trust he shewed himself worthy. He promoted the happiness of the people, and taught them to respect

VOL IV. PART II.

Cæsar as the author of their good fortunes. This, indeed, appears to have been, if not the most splendid, yet the most beneficial part of his public life. Soon after, the first prætorship of the city was conferred upon him by Cæsar: in which act he consulted his inclination, and disobeyed his judgment. Cassius, he said, has the better title to it; notwithstanding Brutus must have the first prætorship. Cæsar was, indeed, so much his friend, that he constantly refused to suspect him of any designs against his government and person. To those who warned him to beware of Brutus, he replied, laying his hand upon his breast, "Do not you think, then, that Brutus will wait till I have done with this poor body?" If this fact, which is recorded by Plutarch, may be admitted, Cæsar was not well acquainted with the character of Brutus. Principle, and not ambition, appears to have been the spring of all his actions. All Rome confessed, that he, and perhaps he alone, of all the conspirators, was actuated by the purest motives,—by hatred, not of the tyrant, but of tyranny. Servility, whoever practised it, and tyranny, in whatever hands, were regarded by him with contempt and indignation. When Cicero was making assiduous court to Octavius, Brutus, in a letter to Atticus, expressed such an opinion of him as he seemed to merit; it was plain, he said, that he took his measures, not for the liberty of his country, but only to obtain a gentle master; and, in a letter to Cicero himself, he accused him of having reared a greater and more insupportable tyranny than that which they had destroyed.

Cassius was offended at the appointment of Brutus to the first prætorship, and he only became reconciled to the latter that he might engage him to destroy Cæsar. It was, indeed, of the greatest consequence to the conspirators that he should be enlisted in the number. His integrity and patriotism were unimpeached and undoubted; and not less respected by the Romans than Cato, he was much more beloved. Having entered into that fatal coalition, his abstraction, when waking, and his uneasy slumbers, shewed that the power of philosophy has a limit, and alarmed the fears of Portia his wife, and daughter of Cato. Her pride was also offended, that he had not imparted his secret, whatever it was, to her; and, to convince him of her power to preserve it, even under torture, she voluntarily penetrated her thigh with a small knife. Afterwards, however, it was plain, that, with whatever fortitude she might endure corporal pain, she could not sustain strong mental conflict with the aspect of tranquillity. On the morning of the assassination, the conspirators were employed in deciding causes with accustomed coolness, waiting the appearance of Cæsar; and, when an appeal was made by some person from the judgment of Brutus to Cæsar, Brutus, looking round him on the assembly, said, Cæsar neither does nor shall hinder me from acting conformably to the laws. In the mean time, Portia, who was in her house at Rome, was agitated with such solicitude and terror, that, after many fruitless enquiries and repeated messages to discover what Brutus was doing in the Forum, she sunk down in a deliquium in the midst of her attendants, and occasioned a rumour in the city, which soon reached the ears of Brutus, that Portia was dead. Almost at the same moment it was announced that Cæsar was approaching in a litter; and Brutus was too much the Roman to be diverted, by any consideration, from what he deemed his duty to his country.

Plutarch informs us, that when Cæsar saw the dagger

5 C

of Brutus pointed against him, he covered his head with his robe, and resigned himself to the swords of his murderers; and that Brutus, in attempting to have his share in the sacrifice, received a wound in the hand from one of the weapons. The sequel proved, how greatly Brutus erred in advising, contrary to the opinion of his companions, that Antony should be spared. His great popularity, both in the city and army, added to his military talents, consular authority, and unprincipled ambition, rendered him scarcely less formidable in a free state than Cæsar himself. Brutus, confiding too much in conscious integrity, erred again in conceding to Antony that Cæsar's will should be read publicly, and that he should have the direction of Cæsar's funeral. The use which he made of the opportunity thus put into his hands, of exciting the multitude, was such, that Brutus and his party thought it prudent to retire from Rome to Antium. Cicero, who was in the interest of the senate, remained in the city, and opposed the whole weight of his authority and eloquence to the usurpation of Antony. Brutus also, courting popular favour, after the manner of the times, caused magnificent shows to be exhibited in Rome in his name, but in his absence.

The arrival of Octavius Cæsar at Rome, and the adroitness with which he appeared to manage Cicero, and win him to his interest, convinced Brutus that Italy afforded no means of serving the cause of freedom. At the maritime town of Elea he took leave of Portia, whose Roman fortitude was again subdued by the sight of a picture, which described the parting of Hector and Andromache. Brutus sailed for Greece, where he began his preparations for the impending war.

A new triumvirate was now formed in Italy,—Cæsar, Antony, and Lepidus, having agreed to divide the empire betwixt them. To meet the rising storm, it was necessary that the two republican leaders, Brutus and Cassius, should unite. Smyrna was the place of their first interview; on which occasion Brutus, knowing that Cassius had collected a vast treasure, by such means as are usual in war, but which himself, either from humanity, or the love of popularity, had refused to employ, desired Cassius to furnish him with the sinews of war, by dividing his treasure with him. The friends of Cassius remonstrated, but he at length consented, that Brutus should take for his use the third part of what he had. Their next interview was at Sardis, where mutual dissatisfaction produced angry altercation, which was, however, amicably terminated. Cassius, being more of a practical man than Brutus, connived at offences which it was not safe to punish, and was less scrupulous of the means by which grand purposes were to be accomplished. Brutus did not refuse to profit by the exactions of Cassius; but, at the same time, insisted, that the malpractices of their partizans should not be suffered to pass with impunity. When the combined army was about to leave Asia, and pass over into Greece, to oppose the forces of the triumvirate, Brutus, sitting alone in his tent by a dim light, and at a late hour, the whole army sleeping around him, was surprised by the sudden appearance of a tremendous spectre at his side. He demanded, What art thou? God or man? and what is thy business with me? To which the phantom replied, I am thy evil genius, Brutus; thou shalt see me at Philippi. Cassius, who was of the Epicurean school, accounted for the appearance philosophically, by remarking, that when the body, as in the case of his friend, was exhausted with labour and vigilance, the

regular functions of the mind are naturally suspended or disturbed. The day of decision was now fast approaching, and the plains of Philippi were the destined scene of conflict. Before the attack, Brutus and Cassius met on the plain betwixt the two armies, and there, it is said, expressed their common resolution, that if the day proved unfortunate, they would die as Cato died. Brutus commanded the right wing, which was opposed to Octavianus in the left, and there obtained a complete victory.

The attack of his soldiers was ardent but irregular; and while they pursued the flying enemy into his camp, and even proceeded to plunder, Cassius, chagrined, exposed, and routed, was obliged to retire with a small number to a hill that overlooked the plain. There, ignorant of the success of Brutus, and believing that the enemy were advancing to take him prisoner, he ordered his freedman, Pindarus, to strike off his head. Soon after, Brutus, who had hastened to his relief with a detachment of horse, entered his camp, and weeping over his lifeless trunk, pronounced him the last of the Romans. Tidings of the death of Cassius soon reached the camp of the triumvirs, and so animated their courage, that, notwithstanding the disasters of that day, they resolved to offer battle the ensuing morning. Brutus, however, declined the challenge, and directed his attention to securing in his interest the remainder of Cassius' army. He now found that it had been easier to reprove his friend for connivance at injustice which he could not prevent, than it was to act up to the rigour of his own principles. Before he ventured upon a second engagement, he thought it necessary to promise his soldiers, that if they acquitted themselves to his satisfaction, he would give them up the cities of Lacedæmon and Thessalonica to plunder. In this interval of preparation, Cæsar and Antony received certain intelligence, that their fleet, which was sailing from Italy with a large supply of soldiers, had been defeated by that of Brutus. As they also knew that this intelligence had not reached Brutus, they were anxious to bring on a second engagement before he should be informed of his naval success. Their offer of battle was accepted; the triumvirs were victorious; and Brutus, that he might not fall into the hands of his enemies, threw himself upon his sword. When Antony found the body, he ordered it to be enveloped in a rich robe; and he afterwards sent the ashes to his mother Servilia. Historians differ in their report of the time and circumstances of the death of Portia. According to some testimonies, she died before her husband; while others record, that being resolved not long to survive the tidings of his death, though her friends deprived her of every instrument of destruction, she accomplished her purpose by taking burning coals from the fire, and retaining them in her mouth till she was suffocated. See Plutarch's *Lives* and *Universal History*. (J. M.)

BRYANT, JACOB, an eminent classical scholar, was born at Plymouth, where his father filled an office in the customs.

He was educated at Eton and King's College, Cambridge, and gave early proofs of that proficiency in classical literature, which afterwards ranked him as one of the first scholars in Europe. His attainments were so conspicuous, that they recommended him to the attention of the Duke of Marlborough, who chose him for his secretary, and afterwards appointed him as tutor to his sons, whom he accompanied in this capacity to Eton.

His friendship with the various branches of that illustrious family, for the honour of all parties, continued unabated till the latest period of his long life; and he was received on the footing of a highly valued friend, not of a humble dependent. Through the influence of the duke, he obtained a lucrative situation in the ordnance department, which enabled him to prosecute his studies without molestation; and to enjoy, what fails to the lot of few scholars, riches, friends, books, and leisure. He lived to the advanced age of 89, and may be said to have flourished during the greater part of the last century. He died at Cypenham near Windsor, where he had long resided, on the 14th of November 1804, of a mortification in his leg, in consequence of a hurt which he received from a chair, in reaching down a book from the shelves of his library.

The life of a scholar is seldom distinguished by any of those bustling incidents which attract the attention of the world: his researches are prosecuted in retirement; and he can explore with greatest advantage the hidden springs of human conduct, or reconcile most readily the anomalous features of human history, when withdrawn from the concerns and ordinary pursuits of the world. It is in his works that we are to trace the progress of those discoveries, which, in many instances, are more useful and interesting to society, than those of the far-famed traveller, or hardy navigator. Whether the speculations of Mr Bryant shall be generally viewed in this light, may perhaps be doubted. They are of too recondite a nature for popular use, but they will never fail to be interesting to the scholar, with all the licence of imagination which sometimes accompanies them. Mr Bryant was not of the number of those scholars who have too frequently issued from the English universities, whose minds are made the receptacle of mere *vocables*, or the measures of rythmical quantities: he endeavoured to apply his great erudition to some useful purpose, and to benefit the world, whilst he indulged his propensity for literary and philological investigations.

His first work was entitled "*Observations and enquiries relating to various parts of ancient history, containing Dissertations on the wind Euroclydon, and on the island Melite: together with an account of Egypt in its most ancient state, and of the Shepherd Kings.*" This work was published in 1767. The account of the shepherd kings is extremely curious; and it is much to be regretted, that the deficiency of materials prevented him from prosecuting the subject so far as could be wished, whilst it compelled him to fill up many chasms with ingenious, but unauthorised conjectures. Indeed the excellencies and defects of Mr Bryant's works are to be ascribed to the same cause, viz. that fearlessness of discussion, which prompted him, on the one hand, to shoot beyond the timid investigations of his predecessors, and on the other, made him too little scrupulous in admitting his own conjectures, when facts were wanting to confirm his theory. It had been doubted whether Melite, the island on which St Paul was shipwrecked, is the modern Malta; because it is said, Acts xxvii. 27. that Melite is situated in *Adria*, or the Adriatic. But Mr Bryant has shown, by conclusive evidence, that the name *Adria* was applied to almost all the sea lying between Sicily and Africa, and that, therefore, we ought not to argue on the restricted meaning which we now assign to that term.

His next and greatest work was the *Analysis of Ancient Mythology*, wherein an attempt is made to divest tra-

dition of fable, and to reduce truth to its original purity. In this work it is difficult to say, whether the ingenuity, the learning, or the industry of the author are most conspicuous. At the same time, we admit that imagination has often supplied the place of facts, and confident assertion been substituted for authentic history. We scarcely know any work in our language whose defects and whose excellencies are so conspicuous, nor any to which we could allow so many abatements on the score of inconclusive reasoning, and yet have so much left to demand our unqualified admiration. It exhibits so many new views, and so many elucidations of obscure transactions, that no man who wishes to be acquainted with the more remote history of our species, can safely be ignorant of the *Analysis of Ancient Mythology*. It might naturally be expected, that a work containing such novel speculations, would excite much opposition, and much admiration. Accordingly we have seen several succeeding mythologists, who, preferring Mr Bryant's unauthorised speculations to the solid facts which he adduces, have carried his mode of reasoning to the utmost pitch of extravagance, so as to prejudice the sober-minded even against his most rational conclusions: whilst others, taking advantage of a few errors in point of fact, or a few slips in point of etymology, have endeavoured to throw discredit on his whole labours, and to represent every part of them as equally uncertain and unsatisfactory. Amongst the latter, Mr Richardson, author of the *Persian Dictionary*, in a dissertation prefixed to that work, has successfully exposed some of his etymological mistakes, with regard to words of eastern origin. This was, indeed, Mr Bryant's weak side, as he was very imperfectly acquainted with the oriental languages, and it is to be feared, had but a superficial knowledge of the Hebrew, and other ancient dialects of the East. He has a favourite theory with regard to the Ammonians, the original inhabitants of Egypt, whose name, as well as descent, he derives from Ham. Nobody would have found fault with him, had he rested satisfied with the latter conclusion: but Richardson has stated an insuperable objection to the derivation of the name: for though the Greeks and Latins used Ammon and Hammon indifferently, yet the *Heth* in *Ham*, is a radical, not mutable or omissible; and had the Greeks or Latins formed a word from it, it would have been *Chammon*, and not *Ammon*, even with the aspirate.

The memorials respecting the deluge, which Mr Bryant has collected from the mythology and history of various nations, are extremely curious and interesting. One of these is the Apamean Medal: (see that article,) his dissertation on this subject was severely attacked in the *Gentleman's Magazine*. Mr Bryant successfully repels this attack, in an essay, printed in the last edition of his works. The medal, indeed, is so very remarkable, that, were we absolutely certain as to its genuineness, we would have very little hesitation in adopting Mr Bryant's conclusions.

Another of Mr Bryant's works, which made a great noise, and excited great opposition, was his observations on M. le Chevalier's description of the Troad. In this work he endeavoured to show that the Trojan war had no foundation but in Homer's imagination; that no expedition was undertaken by the Greeks; and that no such city as Troy ever existed in Phrygia. In this notion he stood almost alone, though he was not without plausible arguments to support his opinion. But every

thing connected with Troy has been so long consecrated by the concurring testimony of antiquity, and by the charms of Homer's muse, that it was deemed a kind of sacrilege to doubt the reality of this far-famed city, and its memorable siege. We have no wish to enter the list in this hazardous contest; as some apology, however, for the aberrations of exalted genius, we would suggest that the testimony of antiquity goes for nothing in this case, as the whole depends on the authority of Homer; and unless authors can be cited anterior to him, or coeval with him, or who did not derive their information from him, or some of his transcribers, the whole history of the war must rest on his authority; and if his authority were equal to his genius, the transactions which he records would stand in need of no other support. But certainly as the subject stands at present, were the alternative proposed to us, we would rather reject the whole as a fable, than receive the half as authentic history.

Mr Bryant published a vindication of Josephus's testimony to Christ, which Dr Priestley confessed had completely convinced him: though he did not show the same deference to a work which Mr Bryant published against him, on the subject of philosophical necessity. Mr Bryant also engaged in the Rowleian controversy, and wrote in favour of the genuineness of the poems. As these poems have generally been exploded as spurious, their supporters have of course obtained but little credit on the score of discernment, and yet Dr Symmons (see *Cumberland's Review*) still ventures to contend for their authenticity, and to produce plausible arguments in support of his opinion.

Mr Bryant's talents and labours were always employed to promote the best interests of man, by supporting the great principles of religion. With this view, at the desire of Lady Pembroke, he wrote a treatise on the authenticity of the scriptures, and the truth of the Christian religion. He also published in 1794, *Observations on the plagues inflicted upon the Egyptians; in which is shown the peculiarity of those judgments, and their correspondence with the rites and idolatry of that people, with a prefatory discourse concerning the Grecian colonies from Egypt*. This is a curious and valuable work. He wrote a volume of dissertations on the prophecy of Balaam; the standing still of the sun in the time of Joshua; the story of Samson and of Jonah; and it is said that other writings to a considerable extent still remain in the hands of his executors.

Mr Bryant was in his person of low stature, and delicately formed; he was remarkably temperate in his habits; and though he, for the most part, lived as a literary recluse, yet he was animated and sprightly in his conversation with those friends whom he admitted to his intimacy. He was liberal of his money, affable in his manners, and piety and religion shed a lustre over all his actions. (g)

BUCCANEERS, an appellation originally given to the French settlers in the islands of St Domingo and

Tortuga, who subsisted by hunting; but afterwards more generally applied to those daring adventurers, who, towards the close of the seventeenth century, infested the West Indian and American coasts.

The splendid advantages which the Spaniards had derived from their trans-atlantic possessions, had long inflamed the cupidity, and awakened the enterprize, of the other maritime powers of Europe. The English, the French, and the Dutch, had sent out various expeditions, with the view of sharing in the same golden harvest, and had succeeded, if not in exploring new regions abounding in the precious metals, like Mexico and Peru, at least in forming establishments in some of the finest portions of the western hemisphere; where the fertile soil, profusely rewarding, without superseding the labour of culture, was likely to prove, in the end, more valuable than exhaustless mines. The Spaniards, naturally jealous of these intruders, were determined, as far as their arms or influence could extend, to oppose all other nations in their attempts to plant colonies in the New World, which they seemed willing to claim, on the right of discovery, as exclusively their own. But their power was too feeble to crush the spirit of enterprise which their example had roused. Successive hordes of adventurers, migrating from the various nations of Europe, were perpetually encroaching upon their dominions, both on the continent and in the islands of America; and while they were thus kept in constant warfare in defence of their territories, the seas were covered with pirates, eager to seize the galleons which wafted to the parent country the treasures of New Spain.

A colony of French, which had been established in St Christopher's island, was advancing rapidly in prosperity, when its progress was interrupted by repeated descents of the Spaniards upon the shores. The assailants succeeded so far as to compel the greater part of the colonists to abandon the island. Burning with revenge, they immediately joined the Dutch cruisers, who then annoyed the Spanish trade, and their resentment was soon gratified by the capture of several prizes of great value. Their success being reported in France, encouraged several merchants of Dieppe to fit out privateers to join their countrymen in that lucrative game. Prosperous in all their enterprises, they now found the island of St Christopher too distant as a depot for their spoils, and resolved to go in quest of some more convenient asylum, to which they might retire in security, as exigencies required. With this view they at first resorted to Hispaniola, whose numerous herds of wild cattle and other animals, afforded an unfailing supply of provisions for their ships, while its situation seemed to render it a convenient and a safe retreat. The Spaniards, aware of the advantages which it offered to the pirates, had already taken possession of the island, and had stationed there an officer named Alferez, with a company of twenty five men. These, however, the adventurers easily expelled, and having rendered themselves masters of the island, began next to deliberate in what manner they might occupy it with most security and advantage. The neighbouring island of Tortuga, though considerably smaller, was in many respects even more inviting than Hispaniola; and it was resolved, by mutual consent, that while some remained on the larger island to be employed in hunting, for the use of their comrades, the animals with which it abounded, others should devote themselves to the culture of the soil in

both islands; while the rest should continue to scour the seas, and should be supplied by those who remained at home with victuals, and every necessary provision; and all, in case of any imminent danger, were to unite in the common defence. The new settlers were not left long unmolested by their inveterate and jealous enemies; Tortuga fell several times alternately into the hands of the Spaniards and the French, till at length the former were finally expelled. Though a considerable portion of Hispaniola was inhabited by Spaniards, the adventurers not only retained possession of the spot where they first landed, but even penetrated far into the country. Some of them engaged in agriculture, but most of them devoted themselves to the chase. It was the latter class alone, that were properly denominated Buccaneers.

The etymology of the word Buccaneer has been traced by Oxmelin, to a custom which prevailed among the original inhabitants of the Caribbee islands, of roasting their prisoners of war upon frames of clay, placed over very strong fires. These clay frames were called *bar-bacoa*; the place where they were erected *BOUCAN*, and the operation *boucaner*, to roast and smoke. What these savages did to their unfortunate prisoners, the hunters practised on the animals slain in the chase, and from that practice they derived their name.

Of these hunters, some were exclusively employed in the pursuit of wild beeves, while others devoted themselves entirely to the chase of wild boars. Though the first of these classes alone were properly distinguished by the name *Buccaneers*, it was commonly given to both; and, indeed, the only difference between them seems to have consisted in the objects of their pursuit; for in their dress, their weapons, and their manners, they were exactly alike. In their rambling mode of life, the Buccaneers seem to have relinquished all the habits of Europeans, and to have acquired, in their general customs and manners, a striking resemblance to the wandering Arabs and Tartars. With them the chase was not the occasional amusement or occupation of a day, but the continued and serious business of whole months and years. They set out on their hunting expeditions in large bands, carrying along with them small tents of linen, which they pitched during their journey wherever they intended to pass the night. Having reached the place of their destination, they erected small sheds, which they thatched with leaves of the palm-tree; and their tents, spread beneath these sheds, were, during the whole of the hunting season, their only abodes. On these occasions, they possessed every thing in common, living in strict harmony, and prevented by no private jealousies or animosities from pursuing, with united zeal, the grand object of their association.

Each hunter was provided with a number of dogs, one or two of which were particularly trained for tracing the prey; and with a musket of a peculiar construction, manufactured in Europe expressly for their use. They were all, likewise, accompanied by their own servants, who shared the same fare, and generally engaged in the same employment with their masters, but were held, notwithstanding, in the most rigorous bondage, and frequently treated with extreme cruelty. During these expeditions, the life of the Buccaneers was laborious, and their fare but mean. When the hunt was finished, however, and they had returned home with their spoils, they indulged in every species of extravagance and licentiousness, till the want of money again

compelled them to submit to the same privations and toils. The few and simple laws which these people had adopted, corresponded well with the rude and primitive state of their society. When two of them happened to quarrel, they referred to the rest of their comrades the cause of their dispute; and if their interference could not produce an accommodation, the affair was decided by duel. Their hunting pieces were the weapons which they made use of on these occasions; and, after measuring their ground, they drew lots for the privilege of taking the first aim. When one of them fell, a strict inquest was held upon his body; and if it was found that his adversary had taken any unfair advantage, he was immediately tied to a tree, and shot through the head.

Such was the state in which the Buccaneers continued to live for more than half a century after their first establishment in Tortuga and Hispaniola, which took place about the year 1632. Several circumstances then concurred to make them, as well as the other settlers in these islands, relinquish their usual employments, and attempt some new means of subsistence. The cattle and wild boars were now nearly exterminated; the assaults of the Spaniards had become more frequent and harassing; and, what was a still more formidable evil, the French government had created a West Indian Company, with peculiar privileges, to colonize the islands which the valour of the adventurers had won, and to establish there a regular trade. Thus deprived of all the advantages which their situation had hitherto afforded, they were still hesitating what new course they ought to pursue, when the splendid success of Pierre Le Grand, a Norman pirate, induced many of them to quit their habitations, and again to try their fortune in cruising against the Spaniards, by whom they had been so much annoyed. With a crew of only twenty-eight determined fellows, sworn to adhere in all extremities to their leader and to each other, Pierre had resolved to attack, in an open boat, the ship of the vice-admiral of the Spanish fleet, which then lay at anchor in the channel of Bahama. He set out about the dusk of evening on this daring exploit; and to render their attack more desperate, had directed holes to be made in the boat, that it might sink as soon as they had reached the enemy's ship. The Spaniards, who had not perceived their approach, were easily overpowered; the captain and officers were compelled to surrender; and Le Grand, detaining as many of the crew as were necessary to work and man the vessel, carried off his magnificent prize in triumph to France. This romantic adventure excited a general spirit of emulation among the Buccaneers of Tortuga, to whom it opened, at the same time, the most flattering prospects. So sanguine indeed were their hopes, and so eager their thirst for spoil, that, without waiting till they could procure proper vessels, they ventured forth in their canoes; and entering the port of the Havannah, carried off a number of boats laden with tobacco, and other articles of value. These prizes enabled them to fit out ships of considerable size, and to undertake voyages of greater length. In their next expedition they took several large vessels laden with plate; their success attracted crowds of new adventurers; and they became so formidable, that the Spaniards found it necessary to send out several large ships of war for the protection of their trade. These pirates, though afterwards joined by the turbulent and daring spirits of various nations, still retained the name of Buccaneers;

and continued to be, for more than twenty years, the terror of every regular trader to the American shores. Even the legends of romance can scarce furnish any parallel to their exploits; and the singular character of their society renders their history an anomalé in the annals of the world.

Drawn together by a common dislike to the restraints of regular society, independence and licentiousness were the leading features in the character of these adventurers. To act in concert, indeed, it was necessary that they should submit to some regulations; but these were dictated, not by the authority of a superior, but by some general feeling of propriety, or sense of expedience. They were generally divided into companies of thirty, forty, or fifty men, electing from themselves, as their captain, the person on whose conduct and valour they placed the greatest reliance. The authority of this captain was seldom acknowledged, except in the moment of battle, when his orders were most implicitly obeyed. Each individual of the crew was obliged to furnish a certain quantity of powder and balls, and to provide himself with a musket, a pair of pistols, and a cutlass or sabre. Having laid in a sufficient stock of provisions, and having determined, by mutual consent, in what place they should cruise, they next bound themselves to agree to certain articles, specified in a written contract, which each of them signed; nor was it ever known that the articles which they had thus sanctioned, suffered the slightest violation. The purpose of these contracts was to regulate, with precision, the share of any prize to which they should be respectively entitled; and to make provision for those who should happen to be wounded or disabled during the cruise. If the boat, or vessel, in which they set out, was the common property of the crew, the first vessel which they captured was to be given to the captain, with a single share of the booty which it contained: if the captain had furnished the boat, he was not only entitled to the first ship which was taken, but likewise to a double share of its cargo. The surgeon was allowed a certain sum, generally 200 crowns, for his chest of medicines, besides one share of the prize. And whoever had the good fortune to discover a ship which was captured, received a reward of one hundred crowns. The remainder of the spoils was distributed in equal shares among the crew. Before this distribution, every man placing his hand on a New Testament, solemnly swore that he had not appropriated or concealed any part of the plunder; and if any of them was convicted of perjury, a case which very rarely occurred, he was conveyed to some desert rocks, as a person unfit for society, and his portion of the prize was either divided among the rest of the company, or appropriated to some religious or charitable use. The loss of an eye entitled the sufferer to 100 crowns, or a slave: the loss of both eyes to 600 crowns, or six slaves. A person maimed of a right hand, or right leg, received a donation of 200 crowns, or two slaves: the loss of both hands, or both legs, was supposed equivalent to the loss of both eyes, and gave a claim to the same sum. If any one happened merely to be disabled in any of his limbs, he was entitled to the same compensation as if he had lost it entirely. So sacred were these claims held, that if they had not money enough to answer them, the whole company voluntarily undertook a fresh expedition, till they realized a sufficient sum to enable them to satisfy such honourable obligations. Their justice and fidelity extended even to those who

had fallen in the common cause. Each of them, before setting sail, attached himself to a comrade, with whom he was to exchange every good office during the voyage; if either of them happened to be wounded, or fall sick, the other tended him with the most affectionate care, and a formal will was made between them, that if one of them should die on the expedition, his companion might inherit whatever he possessed. In the distribution of their plunder, the share which should have fallen to the deceased was faithfully assigned to his comrade; and if both of them had perished, their effects, with their portions of the spoil, were sent, without any diminution, to their nearest relations.

We form, in truth, a very unfair estimate of the character of the Buccaneers, when we regard them merely as a set of robbers, leagued together by an indiscriminate love of rapacity and violence. Their piratical adventures originated in a natural wish to retaliate the many and grievous injuries which they had suffered from the Spaniards, whom they always continued to regard as their only fair and lawful prey; though in cases of extreme necessity, they were sometimes compelled to attack the ships of other nations. It may be difficult to vindicate, on any maxim of morality, an avowed system of plunder. Yet it is certain that this system appeared to themselves, at least, perfectly compatible with the laws of justice and religion; and the regularity of their devotions, and their confidence in the protection of heaven, would have done honour to the champions of the purest cause. They never partook of a repast, without solemnly acknowledging their dependence on the Giver of all good. On the appearance of a ship which they meant to attack, they offered up a fervent prayer for success; and, when the conflict had terminated in their favour, their first care was to express their gratitude to the God of battles, for the victory which he had enabled them to gain. The character of the Buccaneers, however, was formed of inconsistencies: with all this appearance of religion, they indulged in the grossest vices, and were guilty of atrocities, the bare recital of which makes humanity shudder. Their vices arose naturally enough, indeed, out of their situation; for to spend with profusion, and to riot in the wildest excess, was exactly what might be expected of men, who had a constant resource in their valour, who spurned the restraints of regular society, who were inured to continual vicissitudes of privation and abundance, of hardship and ease; and whose occupation exposed them to the constant peril of their lives. Instances of their profusion are recorded, which appear hardly credible. It was no uncommon thing with them to spend two or three thousand crowns in one night. Their captains, on returning from a cruise, would sometimes buy whole pipes of wine, and breaking them up in the street, compel every person that passed to assist them in drinking it. One of them, who had returned from an expedition with three thousand dollars, was, in three months after, sold into slavery for a debt of forty shillings, which he had contracted in a tavern. In short, the maxim on which they uniformly acted was to enjoy the present moment, without regard to the future. Exposed as we are, said they, to such a variety of dangers, our life is totally different from that of other men. Why should we, who are alive to-day, and may be dead to-morrow, think of hoarding up? Our concern is to squander life away, rather than to preserve it. The reasoning was natural, and their character would have been consistent had they made no

pretence to religion. We may apply the same remark to the enormous cruelties which they committed against the Spaniards; for which the law of retaliation, though it affords no apology, would very naturally account; but which were altogether irreconcilable with the mild spirit of that religion, for which they professed a profound regard. If the ships which they captured contained a cargo that pleased them, they generally sent their crews on shore without farther injury: if the prize was of little value, they took revenge for their disappointment on the unfortunate mariners, whom they inhumanly butchered, or threw into the sea.

Having thus attempted a general delineation of the character and manners of these singular pirates, we shall now give a short and hasty narrative of the most remarkable of their romantic adventures. The first of their captains who distinguished himself, after Pierre le Grand, was Pierre Franc, a native of Dunkirk. He had cruized, without success, before the Cape de la Vella, in the hope of intercepting some of the merchant vessels bound from Maracaibo to Campeachy, till his store of provisions was nearly exhausted, and his boat became so leaky as to be scarcely able to weather the sea. In this extremity he formed the desperate resolution of attacking the Spanish barks, which were then engaged in the pearl fishery, in the stream de la Hacha, near the river de la Plata. About a dozen of these barks used to sail annually from Carthagena, protected by an Armadilla, or war ship, mounting from 24 to 30 pieces of cannon, with a suitable crew. The command of this fleet was entrusted to a captain, into whose ship were brought every evening all the pearls which had been fished by the whole fleet during the day. With only twenty-six comrades, as resolute as himself, Pierre Franc attacked the captain's ship, which carried eight guns, and was manned with a crew of three-score well armed men. The Spaniards, after a stout resistance, were compelled to surrender. But the triumph of Pierre was of short duration; he was pursued by the Armadilla, and having lost his mainmast in a squall, was speedily overtaken. The pirates, now only 22 in number, defended themselves with the most obstinate valour; and though compelled at length to yield to such superior force, their enemies were fain to grant them honourable terms of surrender.

Equally daring and more varied were the adventures of Bartholomew, a Portuguese, who had fitted out, in Jamaica, at his own expence, a small brigantine, carrying four guns, and 30 men. He was cruising in this brigantine off Cape Corientes, in the island of Cuba, when he fell in with a large Spanish ship, mounting 20 guns, bound from Maracaibo for the Havannah. Undaunted by the superior strength of this vessel, Bartholomew immediately came up with it; and after an obstinate combat, he at length succeeded in making it his prize. Its cargo was extremely valuable, and the pirates were exulting in their success, when three large Spanish ships unexpectedly bore in sight, and seemed to give them chase. As their prize was heavily laden, it was impossible to escape; and their strength being too inferior to afford them any hope in resistance, they surrendered at discretion. Two days after this disaster, the ships were separated from each other by a furious tempest, which drove the pirates upon the shore of Campeachy. The inhabitants recognised Bartholomew, and immediately condemned him to be hanged. He had already been their prisoner on a former occasion, and found means to

escape. Afraid, therefore, to bring him on shore, lest he should again elude their vengeance, they kept him, loaded with irons, in the ship in which he was taken, till they had prepared a gibbet for his public execution. Bartholomew, apprised of their intentions, resolved still to make an effort for his escape. Having by some means disengaged himself from his fetters, he fastened to his sides two empty jars, so closely corked as to be completely water-tight, and after murdering his centinel, committed himself to the waves. Though unaccustomed to swimming, the jars supported him till he had reached the shore, where he concealed himself in a thick forest not far from the town. Here he remained for three days, subsisting upon wild herbs and roots, and afraid every moment of being taken by the Spaniards. He chose for his retreat the hollow of an old tree, from which he discovered his enemies searching for him through the forest; and when he thought himself safe from their pursuit, he sallied forth towards the shore, with a view of travelling to Golfo Triste, from which he was then about thirty leagues distant. Here he arrived after incredible hardships, and having found there some vessels of pirates to whom he was known, he related to them his misfortunes, and requested them to furnish him with a boat, and 20 men, with whose assistance he engaged to seize the ship in which he had been detained as prisoner, and thus to have some revenge for his wrongs. His request being immediately granted, he came to the harbour of Campeachy by night, and springing on board of the vessel with his comrades, murdered the centinel and the rest of the crew, cut the cables by which she was moored, and before day light was out of view of the town. His triumph on this occasion, however, was as transient as the last; for, while sailing towards Jamaica with his prize, he was overtaken by a violent storm, which dashed the ship to pieces against the rocks of Pinos, and all his newly acquired treasure perished in the waves. Bartholomew, with his companions, reached Jamaica in a canoe; and he engaged in various other enterprises, but was unfortunate in them all.

It would be endless to detail all the romantic exploits of these daring adventurers. In such terror did they keep the Spanish colonists, that they would no longer venture to sail from their harbours; but resigning all the advantages of their situation and connections, formed themselves into so many distinct and separate states. "This," says Raynal, "was the origin of that spirit of inactivity, which continues to this day." This inactivity, however, served only to open new temptations to the enterprise of the Buccaneers. No longer successful in their cruises, they determined to try what they could plunder on shore. The most fertile provinces of New Spain were pillaged and laid waste. Agriculture became as much neglected as navigation; and the dastardly Spaniards were as afraid to appear in the public roads, as to traverse the seas by which their various colonies were disjoined.

In this new species of excursions, Montbar, a gentleman of good family in Languedoc, was particularly distinguished. While yet a mere child, he had accidentally received a circumstantial account of the enormities practised by the Spaniards in the conquest of the New World; and conceived against them an aversion, which, taking possession of his whole mind, arose at length into a species of frenzy. When attending college, he happened to perform in a play, the part of a Frenchman quarrelling with a Spaniard; his imagination took fire, and he fell with such fury upon his companion, whom he

mistook for a real Spaniard, that he would certainly have put him to death, had not the bystanders interposed, and convinced him of his delusion. He could think of nothing, in short, but the deeds of horror which the Spaniards had committed against the unoffending natives of their American provinces; and was inflamed with an irresistible ardour to avenge their innocent blood. With this resolution he sailed from his native country, in order to join the Buccaneers, whom he had heard represented as the most inveterate enemies to the Spanish name. On his voyage to America, the ship in which he sailed fell in with a Spanish galleon, which was immediately boarded by the Frenchman. Montbar, exulting in this opportunity of vengeance, rushed upon the enemy with the fury of a tyger, and hurrying twice from one end of the ship to the other, levelled all who dared to oppose him. He left to his companions the pleasure of dividing the rich booty which they had taken, contenting himself with the savage enjoyment of contemplating the dead bodies of the Spaniards, the first victims of the revenge which he had sworn against their nation. When his ship reached St Domingo, a party of Buccaneers came on board to barter fresh provisions for brandy. As an apology for the trifling value of the articles which they offered, they complained that the Spaniards had overrun the country, laid waste their settlements, and carried off whatever they could find of value. "Why," cried the indignant Montbar, "do you suffer such outrages to pass unrevenged?" "Think not," replied they, "that we are so tame and dastardly. The Spaniards, who dare not attack us openly, took advantage of our absence while employed in the chase. We are now going to join some of our companions, who have been more injured than ourselves, and we shall take ample vengeance for all our wrongs." "Let me," said Montbar, "be your leader; the only preeminence I demand is to be the foremost in attack." The fury that flashed from his eyes, while he spoke these words, at once recommended him to the Buccaneers, as the most proper person to conduct them to revenge, and his offer was cheerfully accepted. That very day they overtook the enemy, whom Montbar attacked with an impetuosity that astonished the bravest of his comrades; and the Spaniards, though far superior in numbers, were routed with prodigious slaughter. The triumph of Montbar was greatly heightened by the revolt of some Indians, whom the Spaniards had engaged in their service. While these men were galling the Buccaneers with their arrows, "What!" cried one of the Buccaneers, pointing to Montbar, "do you not perceive that God has sent you a champion to deliver you from the tyranny of the Spaniards, and will you yet fight in the cause of your tyrants?" The Indians paused for a moment, and seeing the heroism of Montbar, immediately joined his party, and turned their arrows against the Spaniards. The other achievements of Montbar were equally brilliant and successful. He received the name of Exterminator; to which dreadful distinction he was well entitled by the numbers of Spaniards who were sacrificed, both by sea and land, to his restless and insatiable hatred.

The Spaniards, being now obliged to confine themselves within their settlements, the Buccaneers resolved to leave them no security even there. They began, therefore, to harass them by a new mode of warfare, uniting in formidable bands, and making incursions into the territories of their enemies. At the head of the

first of these associations, or regiments of Buccaneers, was Francis L'Olonois, so called from the sands of Olone, where he was born. From the abject state of a bondman, this man had raised himself, by his courage and conduct, to the command of two canoes, with 22 men. He was cruising with them, off the coast of Cuba, when an Armadilla mounting ten pieces of cannon, with a crew of eighty vigorous young fellows, was sent against him by the governor of the Havannah. At the sight of this vessel, the pirates rowed to a creek, where they concealed their canoes among the trees. The frigate, without perceiving them, came to moor in the same creek, and the adventurers, having an opportunity of surveying it at leisure, resolved to attack it without delay. They rowed gently along the shore, under cover of the trees, and stationing themselves on both sides of the enemy's ship, began at break of day to fire upon it from their concealment. The Spaniards failed not to return the fire, without being able, however, to do any injury to their unseen foe. This unequal combat continued till noon; when the Spaniards, having lost the greater number of their men, suspended their firing, and prepared to retreat. L'Olonois immediately pursued them with his canoes, and, after a faint resistance, the Spaniards surrendered. Their barbarous conqueror was proceeding to put all the wounded to death, when a negro slave, dreading the same fate, threw himself at his feet, and offered to make an important discovery if he would spare his life. Having obtained his promise to that effect, he declared that the governor of the Havannah had sent him on board the ship to serve as executioner to the Buccaneers, whom, in the confidence of their being taken, he had ordered to be hanged. Fired with rage at this discovery, L'Olonois ordered all the Spaniards to be brought before him, and struck off their heads, one after another, with his sabre. One alone was left alive to be sent to the governor of the Havannah, with a letter from L'Olonois, in which he informed him of the fate of his frigate and its crew, threatening the same treatment to all the Spaniards who should fall into his hands, among whom he did not despair of yet numbering the governor himself. L'Olonois was now master of an excellent vessel, but his crew was small, and his hopes of treasure had been disappointed. With a view of procuring both men and plunder, he sailed to the port of Maracaibo, where he took, by surprise, a sloop laden with plate and other articles of value. With these prizes he returned to Tortuga, where he was received by the inhabitants with unbounded joy, and crowds of adventurers flocked around him, offering to follow his fortunes wherever he should lead. Among other admirers of his valour and success, was Michael de Basco, who had signalized himself by many daring exploits, and particularly of late, by taking, even under the cannon of Porto Bello, a Spanish ship of war, whose cargo was estimated at one million of crowns. These two adventurers concerted an expedition against the Spanish towns in Terra Firma; and having invited all the Buccaneers then in Tortuga to join in this glorious enterprise, they soon collected a force of 600 men. Michael, being well acquainted with the places which they meant to invade, was to have the command of this force by land; and of the fleet, consisting of about eight vessels, L'Olonois embarked as admiral, in a ship which mounted ten guns. This armament, the largest, which the Buccaneers had ever been able to raise, had scarcely

set sail, when it fell in with and captured two large Spanish ships, one of which, besides an immense cargo of cocoa nuts, contained money and jewels to the value of 50,000 crowns, and the other furnished them with a large store of gunpowder, besides muskets and arms of various descriptions. Encouraged by these captures, which seemed to augur well of the enterprize, they proceeded to the bay of Venezuela, which runs up the country for about fifty leagues. At the mouth of this bay, which is likewise called the lake of Maracaibo, are two small islands, on one of which were erected a watch tower and a fort, to guard the entrance against any hostile fleet. The first achievement of the Buccaneers was to carry this fort by storm, to spike the cannon, and to put to the sword the whole garrison, consisting of two hundred men. They next proceeded to Maracaibo, which they found deserted by the inhabitants, who had retired with their effects to the small town of Gibraltar on the other side of the bay.

The adventurers, on entering Maracaibo, found its houses well supplied with provisions, and its cellars stored with excellent wines. Fifteen days were lost by the pirates in riot and debauchery, and the Spaniards had improved the interval in fortifying Gibraltar by powerful batteries along the shore, barricading the highways, and protecting, by strong entrenchments, every approach to the town. One narrow path alone had been left open for the convenience of the inhabitants, and that path, too, was commanded by a battery. By these obstacles, however, formidable as they were, the intrepid adventurers were not to be discouraged. "Here," cried L'Olonois to his comrades, "are the richest of the Spaniards; we must take them and their treasure, or perish in the attempt." When they had approached within pistol shot of the entrenchments, whole ranks of them were cut down by the artillery and musketry, which the Spaniards levelled against them with a cool and certain aim. But their danger only roused them to more desperate efforts of courage; and the last breath of the fallen was spent in animating their comrades to conquer, or to die gloriously like them. Their perseverance was crowned with victory; with the help of large branches which they had carried with them on purpose, they forced the entrenchments in several places; and, after a furious combat, in which the Spaniards displayed unusual valour, they at last became masters of the town. Of a garrison of six hundred men, four hundred were killed upon the spot, one hundred were wounded, and scarcely a single officer survived the carnage of that dreadful day.

The booty, though large, was insufficient to satisfy the rapacity of these unprincipled robbers, who inflicted on many of their prisoners the cruellest tortures, in order to extort from them a discovery of the places in which they supposed their treasure to be concealed. They remained four weeks in Gibraltar, during which time their numbers were considerably diminished by a violent fever, occasioned chiefly by the putrefaction of dead bodies which they had left unburied on the ground. At length, after setting fire to the town, they returned to Maracaibo, which would have shared the same fate, had not the inhabitants agreed to pay them a ransom of thirty thousand crowns. Not content, however, with this sum, for which they themselves had stipulated, they robbed the churches of their bells, images, and pictures, for the pretended purpose of decorating a chapel which they designed to build in Tortuga. When they came

to share the plunder which had accrued from this expedition, they found it amount, in all, to 260,000 crowns in money, plate, and jewels; besides other commodities, equivalent to at least 100,000 more.

With this booty they returned to Tortuga, where L'Olonois had not continued long when his necessities again compelled him to undertake some new adventure. He soon saw himself at the head of eight hundred resolute fellows, ready for any daring enterprize. When they were out at sea, he disclosed to them his intention of making a descent on the shores of the lake Nicaragua, where they could not fail to find such quantities of treasure as would amply compensate for any hardships or perils they might encounter in their undertaking. His fleet was forced into the bay of Honduras by a current, which baffled all his efforts to get out again to sea. It was therefore resolved to remain there during the rest of the season; and, in the mean time, to plunder all the Spanish towns and villages situated on the two shores of the bay. L'Olonois, with about three hundred of his followers, set out for the town of St Pedro. After a feeble resistance, the town surrendered on condition that the inhabitants should be allowed two hours to retire. That short space of time they employed so well, that the adventurers found but little left behind for them to plunder. On his return to the rest of his comrades, L'Olonois found them extremely dissatisfied with the result of their enterprize, and chagrined at the state of inactivity in which the current forced them to remain. Many of them even secretly resolved to take the first opportunity of returning to Tortuga; and when L'Olonois proposed to sail to the river Guatimala, they openly abandoned him, and under the direction of two of their captains, steered their course towards home. Notwithstanding this defection, L'Olonois proceeded on his enterprize; and arrived at the mouth of the Nicaragua. Here he was immediately discovered by the Indians, who, in conjunction with the Spaniards, suddenly fell on the small band of adventurers, and put most of them to the sword. L'Olonois, with a handful of his followers, escaped into their boats, but were only reserved for more dreadful misfortunes. Compelled by want of provisions to land on the shores of Darien Straits, they were seized by the Indians, who, exasperated by their depredations, tore L'Olonois limb from limb; threw his members, yet quivering, into a fire, and scattered his ashes in the air.

By far the most celebrated, however, of all these adventurers, was a Welshman, named Morgan, generally distinguished by the title of Sir Henry Morgan. Disliking the occupation of his father, who was a wealthy yeoman, Morgan had eloped from home, while yet a boy, and had engaged himself on board a ship bound for the island of Barbadoes. As soon as he reached that place, his master sold him into bondage; and during his servitude, Morgan heard much of the adventures of the Buccaneers, whom he resolved to join as soon as he should recover his liberty. With this view he repaired to Jamaica, the rendezvous of the English pirates; and finding there two vessels ready to sail on a cruize, he offered his services to one of the captains, and was willingly received. After distinguishing himself in several voyages, he proposed to some of his companions that they should conjointly purchase and equip a vessel for themselves, to which proposal they at once agreed, and unanimously appointed Morgan their captain. On his first cruize, he

took several valuable prizes, which he carried into Jamaica. Mansvelt, an old experienced adventurer, was then employed in equipping a considerable fleet, with a design of making a descent upon the continent, and pillaging some of its richest towns. The distinguished success of Morgan recommended him to Mansvelt as a most desirable coadjutor, and he accordingly appointed him his vice-admiral in his projected expedition.

With a force amounting to five hundred men, they proceeded first to the island of St Catherine's, and demolished all its fortifications, except one small castle, which they garrisoned with a hundred of their own men, along with the slaves whom they had taken from the Spaniards. After this conquest, they again set sail, and proceeded to the town of Nata. The governor of Panama having been apprised of their design, they returned to St Catherine's, which they found in the same state in which they had left it. Mansvelt, fully aware of the advantages of this island, as a place of shelter and rendezvous to the pirates, applied to the governor of Jamaica for a force sufficient for its protection. With this request, however, the governor declined to comply; and, in a short time after, the island was retaken by the Spaniards.

The death of Mansvelt having now left Morgan the principal hero among the pirates, he proclaimed his design of making another descent on the Spanish territories, and soon saw himself at the head of seven hundred men. His first expedition was directed against Port-au-Prince, a village in the island of St Cuba, whose extensive commerce, carried on through the medium of the other towns in the island, seemed to promise a booty as rich, as its conquest would be easy. Warned of his design, the inhabitants of Port-au-Prince concealed their treasure, and conveyed their moveable effects to a place of safety.—They next prepared for the reception of their invaders, by mustering all the inhabitants capable of bearing arms, barricading the highways, and placing several parties in ambush, each supported by some pieces of artillery. The adventurers, finding the roads impracticable, made a path for themselves through the woods, and, thus escaping the ambuscades, came to a plain before the town, where the Spaniards were drawn up in order of battle. A sharp conflict ensued, in which the Spaniards were completely routed, and most of them either left dead on the field, or overtaken and slain in their flight.—Those within the town defended themselves with obstinate valour, but were at length compelled to surrender. When the adventurers saw themselves masters of the towns, they shut up all the inhabitants in the churches, ransacked every house for plunder, and laid waste all the country round.

Morgan next resolved to attack Portobello, a strongly fortified town in the province of Costa Rica. His plan of operations was so well concerted, and so ably executed, that he came upon the city by surprise, and took it almost without opposition. But the most respectable of the inhabitants had retired within the castle, where they were determined to defend themselves to the last extremity. In order to reduce them with greater facility, he compelled the women and the priests, many of whom he had taken prisoners, to fix the scaling ladders to the walls, persuaded that the gallantry and superstition of the Spaniards would prevent them from firing upon these objects of their affection and venera-

tion. The governor, however, seeing through the device, desired his soldiers to fire upon all who should attempt to fix a ladder against the walls; and it was not till many of these unhappy persons, as well as of their tyrants, had perished in the assault, that the castle was stormed, and all the Spaniards, except the governor, threw themselves at the mercy of the conquerors. That valiant man resolutely rejected every condition of surrender which they could propose; and, in spite of the tears and entreaties of his wife and daughters, resolved rather to die as a hero, than purchase his life by submission to ruffians.

The adventurers having thus obtained possession of the whole town and its forts, spent some days in collecting all the plunder they could find; and in torturing, with ingenious cruelty, their wretched prisoners, to extort from them a discovery of their hidden treasures. Having loaded his ships with all the booty he could procure, Morgan next compelled the inhabitants to ransom their city from the flames, by the enormous sum of 100,000 crowns; and with this treasure he prepared to return to Jamaica. Before he set sail, a messenger came to his fleet from the governor of Panama, who requested to know by what kind of arms the adventurers were enabled to achieve such splendid exploits. Morgan received the messenger politely, and sent him back to his master with a musket and a few balls, as a specimen of the arms which he employed. The governor, pleased with this mark of civility which he did not expect, charged his messenger with a beautiful emerald ring, as a present to Morgan; and with a letter, expressing his regret that such valour as his should not be employed in a more honourable cause. "Carry my thanks to your master," said Morgan, "for his obliging present; and inform him, that, as I sent a specimen of our arms to gratify his curiosity, he shall soon have the additional satisfaction of seeing in Panama with what address we can use them."

Morgan next proceeded to Maracaibo, which he took without much difficulty, and the spoil of which, with the sum he exacted for its ransom, was estimated at 250,000 crowns. On his return to Jamaica, he was received with great joy by the inhabitants; and new adventurers crowded to him in such numbers, that he soon collected a force of 1000 men. With those he sailed to the island of St Catherine's, which he was anxious to wrest out of the hands of the Spaniards, and to retain as a place of rendezvous, of shelter, and of refreshment to the adventurers, who might happen to be cruising in the neighbourhood. The island was sufficiently strong to baffle the assaults of a much greater army than that of the Buccaneers; yet they obtained possession of it almost without an effort, through the treachery, or the cowardice of the governor, who, on their first appearance, sent privately to Morgan, to concert measures how he might surrender, without sacrificing his reputation as an officer, and the governor of such an important place. It was agreed between them, that Morgan should attack by night a fort at some distance; and that the governor, sallying out for its defence, should be suddenly attacked in the rear, and taken prisoner, after which the fort would immediately surrender. To render the deception more complete, a smart firing was to be kept up on both sides, but so directed as to do no mischief to either army. The farce was admirably conducted. The Spaniards, without being really exposed to any danger, appeared to have fought with great valour;

and the Buccaneers, to secure the possession of the island, demolished its fortifications; and loading their vessels with a prodigious quantity of warlike stores, steered their course towards the river Chagre, for the purpose of invading the city of Panama. The entrance of this river was defended by a fort, apparently impregnable, built upon a steep rock, which projected into the sea. The governor of this castle was a man of extraordinary abilities and valour, and his garrison was worthy of such a commander. The assaults of the Buccaneers were repelled with such effect, that they would probably have been obliged to raise the siege, had not an accident of a very strange nature disconcerted the Spaniards, and reduced them to the necessity of surrendering at discretion. An arrow had pierced the body of one of the Buccaneers, who, with astonishing resolution, pulled it out, and winding a little cotton around it, shot it from his musket back into the castle. The cotton, kindled by the powder, alighted upon the thatch of some houses within the fort, which immediately caught fire; and the flame communicated to a powder magazine, whose tremendous explosion spread ruin and consternation among the Spaniards. In addition to this misfortune, their brave commander was killed, while performing prodigies of valour; and the besiegers, taking advantage of this double calamity, made themselves masters of the place. Morgan sailed up the river in his boats, till he came to Cruces, where it ceases to be navigable. He was still five leagues distant from Panama, on his march towards which, he was met by a considerable body of troops, whom he soon put to flight, and, without farther resistance, entered the city, which was now abandoned. Amazing quantities of treasure were found concealed in wells and caves; and the parties, which were sent to scour the country, returned with much valuable spoil from the neighbouring forests. Not content with this, however, they exercised the most dreadful tortures on the prisoners who had fallen into their hands, in order to oblige them to discover the places where their riches were concealed; and the Spaniards seemed now to be expiating, by their sufferings, the massacres and cruelties of which their ancestors had been guilty in the conquest of those very regions, and in the acquisition of those riches, which were now wrested from them by the same means.

Among the captives taken by the adventurers on this occasion, one lady attracted particular attention. She was a native of Spain, and the wife of an opulent merchant, whose business had some time before called him to Peru. She was still in the bloom of youth; her raven tresses waved over her ivory brow, "like shadows o'er the winter's snow;" her cheeks, naturally ruddy, were heightened by a tropical sun into a warmer glow; and her fine black eyes, dazzling with uncommon lustre, gave animation to the noblest countenance that ever the hand of nature delineated, or poets' fancy conceived. The interest which her unhappy situation excited, was heightened into admiration by her elevated mien; and her whole deportment indicated a soul incapable of being degraded from its native rank by any reverse of condition, or any depth of misery. Even the heart of Morgan, unused as it was to the tender emotions, did homage to this dignified beauty. He felt for her a kind of affection, for which he could not well account; and the natural impetuosity of his temper was checked by an involuntary respect, which her dignity inspired. He assigned her a separate house, with a retinue of servants, whom

he directed to treat with a regard adequate to her former rank. He visited her frequently; he was daily more charmed with her beauty and her conversation; he felt the respect which she had at first inspired, growing into a passion that could no longer be resisted. One of her servants, to whom he disclosed his secret, was employed to learn the opinion formed of him by the lady, and to prepare her for compliance with his desires. At length he ventured to throw out some hints of his attachment, and to usurp some freedoms which her delicacy could not brook. "Morgan," said she, with overawing composure, "your treatment of me, since I became your captive, has given me a high opinion of your benevolence; do not, I entreat you, compel me to change that opinion, by attempting to take an ungenerous advantage of my present misfortunes." He retired abashed; but his disappointment only gave new ardour to his passion. Next day he renewed his visit; avowed his design in still more offensive terms; and chagrined by the lady's determined rejection of his proposals, grasped her with violence, and was proceeding to force her to compliance with his brutal desires. For this emergency the lady was prepared; and displaying a dagger, which she had concealed in her bosom, "Infamous man!" cried she, "urge me no farther. This dagger shall be my protection from your insults. I can bear to die, but shall never be dishonoured." Morgan, perceiving her resolution unalterable, desisted from his attempts, and left her in despair. His pride, mortified by her obstinacy, now converted his passion into deep-rooted hatred; and with the meanness inseparable from ignorance and vulgarity, he revenged with brutal cruelty that inviolable virtue, which a more generous heart would, in similar circumstances, have been inclined to idolize. He deprived her of her attendants; confined her in an unwholesome cellar; and, to give some plausible apology for this unaccountable change in his conduct towards a lady for whom all were interested, pretended that he detected her in a correspondence with his enemies. But his persecution only gave new fortitude to this Spanish Lucretia; and his comrades, impatient of their delay in a place where they could find no more plunder, urged him to depart. Unable longer to withstand their remonstrances, he set fire to Panama; released his prisoners for an immense ransom; and came to the mouth of the Chagre with the richest booty which any party of Buccaneers had ever acquired. He contrived to have the most valuable part of the spoils conveyed on board his own ship, with which he set sail for Jamaica, before dawn of the day appointed for the general distribution, without having given any warning to the rest of his fleet.

After this treacherous act, no expedition of consequence was undertaken by the Buccaneers, till they were conducted by Van Horn, on an enterprize of great daring and importance. This man had served all his life among the French. Himself a stranger to fear, he would allow no symptom of it to appear among his crew. In the heat of engagement, he ranged about his ship, keenly observing all his men; and if any of them betrayed the slightest alarm, he immediately put him to death. This dreadful discipline, while it effectually deterred the faint-hearted from his service, rendered him the idol of the brave. With those whom he approved, he was always ready to share the plunder which he acquired; thus heightening, by his frank liberality, the admiration which his intrepidity naturally commanded. On his former expeditions, which were chiefly confined

to cruising, he sailed in a frigate, which was his own property. In his new designs, which required a greater force to carry them into execution, he was assisted by Grammont, Godfrey, Jonque, and Lawrence de Graff, whose exploits had gained them distinguished renown. Twelve hundred Buccaneers joined themselves, on this occasion, to these celebrated captains, and sailed in six vessels for Vera Cruz. They landed, under cover of the night, about three leagues from the town, for which they instantly marched without being discovered. By break of day they were in complete possession of the place; and the greater part of the citizens were kept prisoners in the churches, to which they had fled for shelter. At the door of each church was laid a train of gunpowder, to blow up the building; and a Buccaneer stood by, with a lighted match, ready to set fire to it on the least appearance of insurrection. Thus the city was pillaged without resistance; and, after three days, the citizens confined in the churches, who had tasted neither meat nor drink during all that time, agreed to ransom their lives and liberties for 10,000,000 livres, equivalent to 437,500*l.* sterling. Half of the money was paid the same day. The other half was levying in the internal parts of the country, when a large body of troops appeared on an eminence; a fleet of seventeen ships at the same time approaching the harbour. The Buccaneers thinking it prudent to retreat, carried off with them 1500 slaves, as an indemnification for that part of the ransom which remained unpaid. They sailed boldly through the midst of the Spanish fleet, which allowed them to pass without firing a single gun; happy to be so easily rid of such dangerous enemies.

About a year after the return of these adventurers from the Gulf of Mexico, the French and English pirates, without any communication with each other, projected an expedition against the country of Peru. Four thousand men embarked in this enterprize; and, had their courage been directed by a skilful commander, they would have wrested from the Spaniards that important country. Instead of acting in concert, they formed themselves into small parties, and after plundering many rich towns, they continued for some years in the country, giving themselves up, as usual, to riot and debauchery. Many of them fell victims to their excess. Of those who survived, some were shipwrecked, on their return, in the straits of Magellan, and at Cape Horn; and some, who attempted to march by land to the Northern Sea, either lost their lives or their plunder, by falling into ambuscades which were laid for them by the Spaniards. In short, the French and English colonies gained little by this expedition, which had lasted four years, and which had deprived them of their bravest inhabitants.

While these adventurers were ravaging the shores of the Southern sea, another band of Buccaneers, commanded by Grammont, was committing similar outrages in the North. Campeachy was the object of their attack; where an incident happened, too honourable to the English character to be here omitted. The citadel, after holding out for some time, was abandoned by its defenders. One gun alone continued to annoy the assailants, which, on storming the fort, they found to be served by an English officer, who had determined to expose himself to any danger rather than basely relinquish his post. Grammont knew how to appreciate such courage; he received this brave officer with every mark of distinction, granted him his liberty, with all his effects,

and complimented him, besides, with some valuable presents. The conquerors of Campeachy spent two months in pillaging the city and the surrounding country. After burning the city, and demolishing the citadel, which the governor refused to ransom, they returned to St Domingo.

The next achievement of the Buccaneers was the capture of the city of Carthagena. Here their bravery was crowned with the most brilliant success, though tarnished with the most atrocious cruelties. Returning home with an immense plunder, they fell in with a fleet of Dutch and English ships, both those nations being then in alliance with Spain. Several of the pirates were taken or sunk, the rest made their escape to St Domingo. This was the last important expedition undertaken by the Buccaneers. The war, on account of the Prince of Orange, which separated the French and English nations; the successful efforts of both nations to engage these enterprising men in the cultivation of land; their prudence in entrusting the most distinguished of the Buccaneers with civil and military employments; and the protection which they both successively engaged to afford the Spanish settlements, concurred to put an end to the society of Buccaneers, certainly the most extraordinary which history records. See Raynal's *History of the East and West Indies*, vol. iii. *Histoire des Aventuriers qui se sont signalés dans les Indes*, par Alexandre Olivier Oexmelin. *History of the Buccaneers of America*, by John Esquemeling. Edwards's *History of the West Indies*, vol. i. (k)

BUCHOREST. See BUCHAREST.

BUCENTAUR, the name of the splendid state vessel in which the Venetians perform the annual ceremony of wedding the sea. See VENICE.

BUCHAN, a district in the north of Scotland, lying partly in the county of Aberdeen, and partly in the county of Banff. The Bullers of Buchan are great hollows in a rock projecting into the sea, on the coast of Buchan. These hollows, which are open at the top, are about 30 fathoms deep, and 50 in diameter. They have three entrances, through which fishing-boats sail without apprehension.

BUCHANAN, GEORGE, a celebrated scholar, of whom any country might be proud, and whose name is peculiarly dear to Scotland. Of the very early part of his life we know wonderfully little; and the little that we do know, is not unmixed with conjecture. He was born in the parish of Killearn, and county of Stirling, about the beginning of February, in the year 1506. His father occupied the farm of Mid-Cowen, or the Moss; but through his premature death, and the contemporaneous insolvency of the grandfather, the family, consisting of five sons and three daughters, were left in extreme poverty. The mother, being a woman of spirit and management, made a successful struggle with the difficulties of her situation, and contrived to rear her numerous offspring in a decent and respectable manner. We have it from tradition, that George got the rudiments of that literature in which he ultimately became so eminent, at the public school of Killearn, which was two miles distant from his native place; and we have it from authority not much superior to tradition (Mackenzie's *Lives of Scotch Writers*), that he afterwards went, whether from choice or from necessity we are not informed, to prosecute his youthful studies in the school of Dumbarton. His maternal uncle, James Heriot, perceiving the superiority of his talents, paid him the at-

tention of a kind and liberal patron, and sent him, when he was about fourteen years of age, to the university of Paris, where he improved his knowledge of Latin, acquired the Greek language by his own unaided exertions, and first began to shew and cultivate his poetical powers. He had not been two years at Paris, when his uncle died, and left him in a state of great destitution, the misery of which was aggravated by a severe distemper, induced, it is probable, by disappointment and mortification. This unfortunate event obliged him to return to Scotland. After devoting a considerable time to the restoration of his health, he entered the army, in which he continued for a year, engaged in active and dangerous warfare with England, mingling with enthusiasm in military operations, and preparing himself for giving those animated descriptions of gallantry and fortitude which are to be met with in his *History of Scotland*. The first campaign, however, in which he served as a soldier, was extremely inglorious; and while no honour was acquired, the hardships which he had to suffer so much affected his constitution, that he was for several months confined to bed. As soon as he had completed his eighteenth year, he went to the university of St Andrews. He there received the degree of Bachelor of Arts, in the year 1535, at which time he was a pauper or exhibitioner. He soon after went a second time to Paris, where he became a student in the Scottish college. There he obtained various degrees of merit; and in the year 1529, secured, by competition, the procuratorship of the German nation, which was one of the four classes into which the students were divided, and comprehended those from Scotland. But what was of still greater consequence, he there imbibed the spirit and sentiments of the Reformers, which by that time had made considerable progress on the Continent. At the expiry of two years, he was appointed a professor in the college of St Barbe. In that situation, he taught grammar for three years, without receiving, however, any remuneration that was at all adequate to the extent or value of his labours. Indeed, it appears from his elegies, and from the writings of other authors, that the teachers of humanity were, at that time, in a most wretched condition in point of emolument, and that Buchanan, in this case, experienced only what was common to all who held that honourable and useful office. In the year 1532, he became tutor to Gilbert Kennedy, Earl of Cassilis, to whom he inscribed his first work, a Translation of Linacre's *Rudiments of Latin Grammar*, and whose conduct in after life reflected no small credit on the abilities and virtue of his preceptor. With this young nobleman, Buchanan returned to Scotland in 1537. Having spent some time in his native country, during which he quarrelled with the Franciscan friars, in consequence of a satirical poem, entitled *Somnium*, he determined to go back to France, and betake himself to his former employment; but James V. retained him as preceptor to his natural son James Stuart, who died in the year 1548. The Franciscans, whom Buchanan had deeply offended, and whose favour he shewed no inclination to regain, endeavoured to make the king his enemy; but so far were they from succeeding in this attempt, that James, who had no reason to love them, only instigated the poet to make fresh attacks upon their principles and character. In his *Franciscanus*, he exposed their ignorance, their irreligion, and their vices, in a strain of such appropriate and masterly ridicule, and in language so powerful and captivating, as to render him, ever after, the

object of their unqualified hatred and resentment. Very soon, indeed, they tried to sacrifice him to their vengeance, by comprehending him in the general arrest to which many Lutherans were then subjected, and giving him over to trial and punishment for his alleged heresies. But he had some friends at court by whom he was warned of his danger; and, though Cardinal Beaton was his active and zealous enemy, he fortunately escaped from the apartment in which he had been confined, and succeeded in getting to London, where he was protected from the hostility of the Papists by Sir John Rainsford, to whom he has gratefully inscribed a small poem. In London, however, he did not remain long. His spirit was too proud to brook the necessity under which his indigence had laid him, of practising literary mendicity; and his love of freedom was too ardent to admit of much attachment to a country in which the monarch was a capricious, unprincipled, and cruel tyrant. He therefore went again to Paris, where there was more of that civilization which his mind relished—where he had a greater number of literary associates—and where he could hope to enjoy a larger share of personal safety: but, on his arrival at Paris (1539), he found Cardinal Beaton living there in the capacity of ambassador; and knowing well both the power and the temper of that relentless persecutor, he embraced an opportunity which immediately occurred, of retreating to Bordeaux, and fixing his residence there, as a professor of the Latin language in the college of Guienne, which had been lately founded, and became, chiefly through his exertions, one of the most distinguished schools of learning in France. In Bordeaux, Buchanan was respected and happy. His accomplishments, both as a scholar and as a poet, were such as to insure the esteem of all with whom he associated, or to whom he was known; and not only in the college and the city, but also in the neighbourhood, he found a considerable number of men, whose taste and pursuits and attainments were similar to his own, and whose society, therefore, he enjoyed with a peculiar relish. Among these, the elder Scaliger, who resided at Agen, deserves to be particularly mentioned, as one who was himself a great scholar, and whose admiration of the Scottish poet was high and permanent; who entertained Buchanan, and other enlightened inhabitants of Bordeaux, with the utmost hospitality; and who, in the company of such men of learning, equally forgot the tortures of the gout and his natural love of dogmatism and contradiction, for his own personal satisfaction, and the advantage of others.

While Buchanan paid every attention to the duties of his official situation, (though, by the way, he does not seem to have been much in love with the laborious and ill-rewarded profession of a teacher), he continued to court the muses, and at once to improve and to display those great talents which he possessed as a Latin poet. To correct and refine the dramatic taste of the French nation, so far as his official influence and individual efforts enabled him to go, he applied himself to the composition of tragedies for the academical stage, and drew off the attention of the students from the rude and absurd representations to which they had been accustomed, to those more correct and polished models which had been exhibited by the ancient theatre. His success in this department of literature was equal to his expectations. In the course of three years, in the midst of his fatiguing avocations, and in continual apprehensions of the enmity of Cardinal Beaton, who was using every

method of getting him apprehended, he wrote four tragedies, which, notwithstanding many faults, are, on the whole, admirable specimens of a poetical mind, and especially of skill in the Latin language. Two of them were translations of the *Alcestis*, and the *Medea* of Euripides, who was his favourite author; the other two were original, and entitled *Jephthes* and *Baptistes*, both of which have been translated into several languages. Of these, *Jephthes* is distinguished by considerable interest of subject, and many beauties in delineation; but *Baptistes* contains more of the characteristic marks of Buchanan's mind, as it declaims boldly against priestcraft and tyranny, and inculcates, throughout, the love of civil and religious liberty.

While in Bordeaux, Buchanan wrote various other poems, and particularly devoted one to the laudable purpose of securing the substantial patronage of Olivier, chancellor of the kingdom, to the college of Guienne. In this he succeeded, and then inscribed an elegant tribute of gratitude to the chancellor for his liberality. He also addressed a Sapphic ode to the youth of Bordeaux, in order to recommend to them the study of the liberal arts; and in this also, he appears to have attained his object. Having to the best instructions, united the most brilliant and winning example, he at once stimulated to the pursuit, and promoted the acquirement, of elegant literature.

After residing for three years at Bourdeaux, Buchanan went to Paris, where he officiated as a regent in the college of Cardinal le Moine till the year 1547. It appears from one of his elegies, that for a considerable time he was dreadfully afflicted with the gout. The elegy, however, in which he records the fact, shews that the disease had not impaired the vigour of his imagination. His associates in this new situation, were worthy of being connected with him; and it has been remarked, that humanity was taught in the same college, at the same period, by three of the most learned men in the world,—Turnebus, Buchanan, and Muretus. From Paris he went to Coimbra, where the king of Portugal had lately established a university; and there he had for his colleagues, Govea, to whose friendship he had been formerly indebted,—Gelida, Tevius, and many other celebrated scholars. Govea, however, dying unexpectedly in 1548, and the protection which he had hitherto afforded to his learned coadjutors being of course withdrawn, they were most bitterly persecuted by the Portuguese. Buchanan, in particular, was marked out for a victim. The most foolish and unjust accusations were preferred against him. Two individuals formally deposed to his being inimical to the Roman faith. It was known that he had written a poem in ridicule of the Franciscans, and, besides some uncatholic notions concerning the Eucharist, he had been guilty of a crime no less heinous than that of eating flesh in Lent. In these circumstances, it was wonderful that the Inquisition, before which he had been brought, permitted him to escape with his life. The termination, however, of that harassing trial to which he had been subjected for a year and a half by the inquisitors, was neither severe nor unfortunate. He was sentenced to be confined in a monastery, that he might enjoy the privilege of being edified by monks, much more ignorant of religion than destitute of kindness. Under their tuition, he continued for several months, and it was during that period that he commenced his beautiful version of the *Psalms of David*—a task which some allege was imposed upon him as a penance

by his ghostly instructors, but which, it is more probable, he imposed upon himself, for the purpose of solacing his pious spirit amidst the evils of his condition. Whatever was his motive for beginning this work, it is certain that he has accomplished it in a manner which does infinite honour to his genius, and which places him, though he had written nothing else, in the very first ranks of modern Latin poets. The first specimen of it was published at Paris in the year 1556.

As soon as Buchanan regained his freedom, he determined to set out for France, to which country he seems to have cherished a warm and constant attachment, and solicited the king for a sum of money sufficient to defray the expence of his journey. The king was unwilling to part with him; and, in order to induce him to prolong his stay, bestowed upon him a small supply, and made him a promise of future and suitable preferment. The supply being little, and the promise of very doubtful performance, he embarked at Lisbon, and arrived safe in England. There, however, he did not long remain. The aspect of political affairs was very discouraging; and though he might have received such promotion as would have pleased other men, yet at that time his affections were so strongly placed on France, that he almost immediately (1553) departed for that favourite land. The French nation were fond of him, and considered him in some measure as their own; and the warmth and extent of his attachment to them may be seen in a poem written by him on this occasion, entitled *Adventus in Galliam*, in which he praises the country for every thing that is beautiful in nature, liberal in art, refined in manners, and great in arms. Soon after his return to Paris, he was made a regent in the college of Boncourt. In the year 1555, he became preceptor to Timoleon de Cossé, son of the celebrated Comte de Brissac, who at that time was invested with the government of the French dominions in Italy. Marshal de Brissac was a great warrior, but of liberal sentiments, and fond of the society of learned men. Buchanan resided in his family for five years, conducting himself with his accustomed propriety, and at once instructing the son in the elements of literature, and assisting the father with his counsel, and delighting him with his conversation. A civil war breaking out in France, Buchanan returned in haste to his native country. There he was employed at court (1562) as classical tutor to Queen Mary, who was then in her twentieth year; and we find by a letter of Randolph's, that he read with her, every afternoon, a portion of Livy; a circumstance which places in a very respectable light the attainments of that accomplished but imprudent and unfortunate princess.

Buchanan arrived in Scotland just about the time (1560) when the reformed religion had triumphed over Popery, and obtained the sanction of Parliamentary enactment. To that religion he had all along been secretly attached; and though his attachment was founded on a rational conviction of its superiority and truth, he himself acknowledged that he was much confirmed in his principles by the treatment which he had received from the grey friars. He accordingly professed himself an adherent of the new doctrines. His accession to the number of the reformed was considered as of sufficient importance to merit their best regards; and by the Earl of Murray, who was not only one of them, but a patron of learning and of learned men, he was appointed principal of St Leonard's college in St Andrew's. In consequence of holding this office, he was obliged to

prelect on theology; and it is recorded, that his prelections were those of a man who had studied his subject, and that they displayed the characteristic ability of their author. He had not been long in Scotland, when he thought of publishing a correct edition of his various poetical works. His version of the *Psalms* being now completed, he put it into the hands of the celebrated printer Henry Stephens, who kept the manuscript so long beside him, that he has been accused of a design to claim it as his own, in the event of Buchanan's death. This accusation, however, does not appear to have been well founded. The work at length appeared, and excited universal admiration. Several attempts were made to give a Latin version, or rather paraphrase of the *Book of Psalms*; but though some of these, particularly that of Arthur Johnston, possess great merit, and in certain points may be considered as equal, if not superior, to the production of Buchanan, it is the general and established opinion, that on the whole, he is quite unrivalled. Even of *Johnston's Psalms*, we seldom hear; but *Buchanan's Psalms* are known to, and spoken of by every scholar in Europe. This elegant work the author inscribed, in a poetical dedication no less elegant, to Mary, whose studies he was probably superintending at the time. The queen rewarded him for his merits and for his compliments, by conferring on him the temporalities of the abbey of Crossraguel, which were very considerable. He also published a collection of satires, entitled *Fratres Fraterrimi*, which had been composed at various periods, and were chiefly directed against the doctrines of the Popish church, and the licentiousness of the Popish priests. By these effusions of wit and ridicule, he certainly promoted the cause of the Reformation. The abettors of that cause were encouraged by the efforts of such an able friend; and its adversaries were put to silence and to shame, by a weapon which the very nature of their superstition, and the notorious practices of their clergy, made it impossible for them to resist. In the year 1567, he published another collection, containing *Elegiæ, Silvæ, Hendecasyllabi*.

As Principal of St Leonard's College, Buchanan was regarded with the highest reverence and esteem: in proof of which, various marks of honour were conferred upon him. He was also repeatedly a member of the General Assembly. Of that court, in 1567, he had, though a layman, been chosen moderator; and he was formerly one of the commissioners appointed for revising the Book of Discipline. But Buchanan was now to appear in a new character, and to take an active and decided part in the politics of his country, which at that period were in a very disordered and critical state. The first transaction in which he engaged, was one of a nature equally extraordinary and delicate. Elizabeth having required delegates to be sent from Scotland for the purpose of conferring with respect to the conduct and situation of Mary, who was then a prisoner in England; and Murray the Regent, with other distinguished persons, having gone on that embassy, Buchanan was one of several who were appointed to accompany them as assistants. He became a powerful co-adjutor, by composing a work, in which he endeavoured to detect and expose the wicked actions of the Scottish Queen. This work was submitted to the commissioners during their conference at Westminster (1568), and was afterwards circulated most industriously through the kingdom by Elizabeth and her ministers. This part of Buchanan's conduct has been severely condemned by

Chalmers, Stuart, and other writers of the same stamp, who have broadly accused him of the foulest and most aggravated ingratitude to Queen Mary. The benefits conferred upon him by that princess have been much exaggerated, in order to render his alleged misconduct the more glaring and unpardonable. One thing is certain, that he was not patronized or promoted beyond his real merit and his professional services. But even allowing the greater part of what has been asserted on that point to be true, the charge of ingratitude is not necessarily substantiated. Buchanan, doubtless, was placed in circumstances which must have been painful to an ingenuous mind, and which it is to be presumed were painful to his. There was a contest between private feeling and public duty; and had Buchanan been a man of narrow views, or sentimental imbecility, he would have preferred the claims of the former to the obligations of the latter: but as he thought vigorously, and felt nobly, he merged what he owed to an individual in what he owed to his native country; and that he might do a service to the cause of humanity, and religion, and freedom, (for all these were believed to have been violated by the queen), he was contented to lie under the suspicions and to suffer the obloquy to which his patriotism might expose him. It should not be forgotten, that he did not abandon his queen till she had openly renounced those principles and virtues, by the exercise of which alone, she could justly expect his allegiance and support. When Murray, to whom he was strongly attached, was assassinated (1570) by Hamilton of Bothwellhaugh, Buchanan feeling the keenest indignation against the family of the assassin, and suspecting that their bloody purposes were not yet fully executed, wrote an admonitory letter on the subject, "*Direct to the trew Lordis, Manteners of the Kingis Graces Authority.*" During the same year, he wrote a satirical tract in the Scottish dialect, entitled "*The Chamelcon*," in which he exposed, with great success, the unsteadiness of Secretary Maitland's political principles and conduct. This production, however, was suppressed at the time, by the vigilance of the secretary, and indeed was not printed till the beginning of last century. Very soon after the death of Murray, Buchanan was nominated to be one of the preceptors for conducting the education of the young king, who was then only four years of age. This very delicate and important office, he executed with his characteristic talent and integrity, communicating to his royal pupil the classical knowledge which he was so well able to impart; instilling into his mind those sentiments which became his station and his destiny; and fearlessly subjecting him to that discipline, which the prospect of a crown generally renders more necessary than agreeable. James, who in some respects profited considerably by Buchanan's tuition, long remembered the commanding aspect and authoritative manner of his preceptor; but that monarch did not realise the anticipations which Buchanan had fondly cherished of his reign, and permitted the liberal and enlightened sentiments which had been inculcated upon him with the utmost solicitude, to be superseded by an inordinate love of prerogative, or impaired by a silly resentment against his preceptor for his treatment of his unworthy mother. At the same time that Buchanan became preceptor to the king, he was made a director of the chancery; and, in 1570, he was invested with the office of keeper of the privy seal, in room of Lord Maitland, which office he appears to have held so late

as the year 1580. While Buchanan acted the part of a politician and a statesman, he continued to act also as a scholar; for we find him occupied, by special appointment, in composing suitable grammars for the use of schools, which then laboured under great defects in that important particular. He afterwards employed his pen in drawing up a memorial respecting the reformation of the University of St Andrews, in pursuance of a commission granted by the parliament in 1578, for reforming all universities and colleges within the realm. About this time, it is evident, that Buchanan stood uncommonly high in the estimation, not only of his own country, but of the world at large. He corresponded with the most eminent literary characters of the age. He was applied to by the king of Navarre, and other zealous Protestants on the continent, to promote the reformation, by using his influence with the monarch and people of Scotland. And some distinguished critics abroad solicited him for contributions to their editions and illustrations of the ancient classics—a department of literature to which he had not paid much attention, but in which his natural sagacity, and his extensive learning, certainly qualified him to excel.

His correspondence, it is evident, was very extensive, but unfortunately a very inconsiderable proportion of it has been preserved. A small volume is all that remains, to which there is no prospect of any augmentation. Notwithstanding the many avocations which consumed so much of his time, and the infirm and precarious state of his health, Buchanan had found leisure to compose a treatise of political philosophy, under the title "*De Jure Regni apud Scotos Dialogus*." It was published in 1579, and dedicated to the young king, his pupil. The subject, as announced in the title, is local and limited; but, as discussed in the body of the work, embraces the general maxims and principles of government, which the author lays down with much precision, and expatiates upon with much eloquence. This book excited a great deal of attention, and procured for Buchanan high applause from the friends of liberty, and most bitter hostility from the abettors of popery and despotism. When Buchanan reached the 74th year of his age, he drew up a short account of his life. It is characterized by elegance, simplicity, modesty, and candour.

The last work which he completed was his *History of Scotland*. It issued from the press in the year 1582. With this admirable production, every scholar is acquainted. Of its classical merits, no doubt can be entertained. Some, who must be considered as among the most competent judges, have not scrupled to prefer it to the elegant productions of Livy. As a history, it has some faults, but these are far more than counterbalanced by its excellencies; and although the author's political leanings, and his occasional attachment to fable, have subjected his authority to a degree of doubt and suspicion, yet the more his material facts have been investigated, the more reason has appeared for confiding in his correctness and veracity.

A short time before his death, Buchanan was visited by some learned friends, and they found him employed in teaching the hornbook to a young man in his service! They held some conversation with him, chiefly respecting his *History*, which was then in the press, and which they thought contained some dangerous passages. In the course of conversation, he exhibited that firm regard to truth, and that undaunted boldness in stating it, by

which he had been long distinguished. He expired on the 28th of September, 1582, in the 77th year of his age, and was interred in the burying ground of the Greyfriars. For more particular information concerning this celebrated character, the reader may consult *Buchanan's Life, written by Himself*, and the various publications referred to at the end of Dr Irving's *Memoirs of the Life and Writings of Buchanan*,—a very able and interesting work, and much less known than it deserves. (7)

BUCHARA, BOKHARA, or BOGAR, a city of Asia, in Great Bucharia, from which that country derives its name, is situated on the river Sogd, about 100 miles west from Samarcand. It stands on a rising ground, and is surrounded with a slender wall of earth. It is large and populous, and divided into three quarters: The Khan, with his Tartar court, inhabits the one; the officers of the court, and other servants of the prince, another; and the third, which is by far the most extensive, is occupied by the citizens, merchants, and other inhabitants. This last is also subdivided in such a manner, that every trade has its particular department. The houses are low, and composed chiefly of mud; but the mosques, baths, and other public buildings, are of brick, and well built. The city was anciently distinguished for its arts and sciences; and it is even maintained by some, that it received its name from this circumstance: Buchar signifying, in the Mogul language, *learned*; and Bucharia, the country of the learned. Its university was frequented by students from every part of the Mahometan dominions, where they were instructed in every branch of literature; but particularly in the theology of the Moslems. From the situation of Buchara, it soon rose to be the chief emporium of commerce in this country. It was the resort of merchants from India, Persia, Turkey, Russia, and Poland; and its warehouses were filled with Oriental and European merchandise. But since the subjection of Bucharia by the Usbeck Tartars, it has greatly fallen from its ancient opulence. Its commerce has languished under the oppression of its rulers; and it is now visited by few foreign merchants, on account of the extraordinary extortions to which they are exposed from the Khan and his officers. Its manufactures are soap, cotton-yarn, and calico, which, with the produce of the surrounding country, as cotton, lamb-furs, down, rice, and cattle, they export to Persia, and receive in return, velvet, silk, sashes, cloth, indigo, coral, and cochineal. But its fine linens, for which it was so famous in the tenth century, are now unknown. During the invasion of this country by Zengis Khan, Buchara, which was then strongly fortified, endured a protracted siege of nearly twelve months, which so exasperated the Mogul, that, after its surrender, he set fire to the city, which, being chiefly constructed of wood, was reduced to ashes, and nothing of it was left, but the sultan's palace and a few houses, that were built of stone. After continuing some time in this desolate state, Zengis ordered it to be rebuilt a little before his death. It is now the residence of the Khan of Buchara, who is a despotic prince, but whose power, however, reaches but a little way without the city. N. Lat. 39° 20'; E. Long. 61° 58'. See *Recueil de Voyage au Nord*. tom. x. p. 158; and *Hanway's Travels*, Vol. I. p. 242.

BUCHAREST, BUCHOREST, or BUCCAREST, a town of European Turkey, in the province of Wallachia, is situated on the river Damboziza, and is the residence of the Hospodar, or prince of Wallachia, and the see of a

Greek archbishop. It shows at a distance numerous cupolas, and a vast extent of buildings; but it consists merely of a collection of villages, without plan or regularity. The houses are very mean in general. The best of them are built of stone, and covered with wooden tiles; and when Mr Chissul visited Wallachia in 1702, the greater number were under ground like cellars, and covered at the top with straw, or bark of trees. The gardens are very wide, and enclosed with entire trunks of oak, set closely together. The streets are paved transversely with planks of wood, about ten yards long, and as many inches thick, and appear like one continued bridge throughout the whole extent of the city. The planks are often badly fastened, and much decayed, which renders walking very disagreeable and tedious. This town is said to contain 400 convents and churches; the principal of which are, the patriarchal church adjoining the palace of the archbishop. It has four cupolas, and stands on an eminence, commanding a pleasant view of the city. The church of St George, the patron saint of Wallachia, is built in the best modern Greek style. Its portico is supported by short spiral columns, with an imitation of Corinthian capitals; and the interior walls are spread over with fresco paintings of saints, particularly of the equestrians, St George and St Demetrius, as large as life. The palace of the Hospodar has a very mean appearance. It is low, and built of wood, with slated towers over the gate-ways; and stands in a court, which also contains a church, and a range of barracks. The meanness of this establishment is easily accounted for, by the frequent changes of its inhabitants, who are little anxious about present conveniences and splendour during their short and precarious government, provided they can amass enough of wealth from their temporary subjects, to return to the shores of the Bosphorus, and the enjoyments of Asiatic luxury. In the centre of the town are the bazars, which consist of several rows of open shops, protected from the mid-day sun by a roof of timber frame. Here the mechanics are employed, and a great variety of wares exhibited. As the environs of Bucharest abound in corn and wine, and excellent pasturage, its principal trade consists in the exportation of provisions to Constantinople. The inhabitants are chiefly Christians; but their houses, manners, and dress, resemble much those of their Turkish masters. This town has been subject at different times to the Russians, the Austrians, and the Turks; and was delivered up to the latter power at the peace of Sistova, on the 4th of August, 1791, under whose dominion it has since remained. It is nearly 50 miles S. E. of Tergowitz, and 250 N. N. W. from Constantinople. Population, 60,000. N. Lat. 44° 30'; E. Long. 25° 51'. See *An Itinerary from London to Constantinople*, p. 53, in *Philip's Coll. of Voyages*, &c. vol. i. (h)

BUCHARIA (GREAT), or BOKHARIA, a country of Asia, and part of Independent Tartary, is bounded on the north by the river Sirr and the mountains of Argjun; on the west by Kharism, Chorasán, and the desert of Margiana; on the south by the Gaur and Hindoo Koh mountains, which separate it from Persia and Hindostan; and by the chain of Belur Tag, which separates it from little Bucharía, on the east. It lies between 35° and 45° of N. Lat. and 59° and 73° of E. Long. and is supposed to comprehend the Sogdiana and Bactria of the ancients, with their dependencies. The northern part of it, also, corresponds with the Mawera'n-nahr of

VOL. IV. PART II.

the Arabians, which signifies the country beyond the river, and is the same with the ancient Transoxana. Bucharía contains the kingdoms of Samarcand, Balk, and Bucharía properly so called; each having a town of the same name, except Bucharía, whose capital is Buchara, from which the country takes its name. There are, however, other divisions, many of which, though included in these kingdoms, are subject to separate governments. Towards the north, are the provinces of Fergana, Osrushna, and Sogd; towards the east, Vash, Kotlan, and Kilan; and on the south, Gaur, and Tokarestan. Of these, Fergana is subject to the Kirguses, and Gaur to the king of Candahar. This country presents an agreeable variety of hill and dale. The mountains are lofty and extensive, and the plains are plentifully watered by the Amu and the Sirr, with their tributary streams.

The Amu, or Jihon, the ancient Oxus, has its source in the Belur mountains, and directs its course towards the south-west, passes by Badakshan and Termed, after receiving numerous streams from the mountains of Ak-Tau on the north, and Hindoo Koh on the south. When it leaves the latter city, it turns towards the north-west, and being joined by the Dehash, Sogd, Morgab, and Kizil Daria, it falls into the sea of Aral, after a course of nearly 900 miles.

The Sirr, or Sash, sometimes called the Sihon, rises in the mountains of Terek Daban, or northern part of the Belur chain, and taking nearly the same direction as the Amu, washes the cities of Andegan, Cojend, Tashkund, and Tuncat; and then traversing the desert of Burzuk, it falls into the eastern side of the Aral. During its course, which is about 350 miles, it receives many tributary rivers; and it is supposed by some that it is joined by the great river Sarasu from the north; but so imperfect is the geography of this country, that the direct course of that river is yet unknown. Great Bucharía is the best cultivated and most populous region of Independent Tartary. It is inhabited by three distinct nations; the Buchars, who were its original inhabitants; the Moguls, who established themselves here under Zagatai, the second son of Zengis Khan; and the Usbeck Tartars, who are now its actual masters.

The Buchars are a quiet and inoffensive race, composing the principal population of the towns and cities, and employing themselves entirely in trade and commerce. They never interfere with war, but content themselves with conscientiously paying the taxes for its support; on which account they are despised by the Tartars, and treated as a debased and pusillanimous people. They are, however, far superior to the Tartars in manners and appearance. They are, in general, tall, elegant, and well made, with black hair, and an open lively countenance. The women are also well shaped, with fine complexions and beautiful features. Their garments correspond with their peaceful dispositions; a long calico robe, reaching to the calf of their leg, over which they wear a vest of quilted silk, and tied round the middle with a silk crape girdle or sash; trowsers, with light boots like Persian buskins, and a turban, or round cloth bonnet, bordered with fur, constitute their dress in summer. In winter, they are covered with a long cloth gown, lined and trimmed with fur. The robes of the women are full and loose; their bonnets small and coloured; and their hair hangs in long tresses, and is decorated with ribbons and jewels. The

Usbeck and Mogul Tartars, on the other hand, are clothed for war. Their dress is short, and adapted for exercise. They are the most robust and warlike of all the Tartars, and are continually engaged in hostilities with the Persians. The dart, the arrow, and the spear, were formerly most formidable weapons in their hands, but they are now accustomed to the use of fire arms. They, however, still wear coats of mail, and sometimes a shield, to defend themselves from the sabre. Their wives are equally brave and hardy. They often follow their husbands to the field of battle, and undauntedly mix in the slaughter. Their food consists of boiled rice and horse-flesh, and their usual beverage is *kumias* and *arak*, which are both extracted from mares milk. The summer is spent in predatory excursions, or in wandering over the country, pitching their tents wherever the herbage is most luxuriant; and in winter, they retire to the towns and cities. Such of them as are employed in agriculture, live in villages and hamlets. The Tartars are governed by khans, whose power is despotic. The chief of these are the khan of Balk on the south, and the khans of Samarcand and Buchara on the north. The authority of the latter, however, was, according to Hanway, confined, in 1741, to the city, and a small territory around it. The Buchars have no government of their own, but are subject to the khan in whose dominions they reside, and to whom they pay an annual tribute for his protection.

The inhabitants of this country have been highly extolled for their hospitality and generosity; and such is their disposition in these respects, that no opportunity is omitted of performing kind offices to strangers, and every peasant keeps a portion of his cottage, however small, for the reception of a guest. "I happened once to be in Sogd," says Ebn Haukal, an Arabian traveller, "and there I saw a certain palace, or great building, the doors of which were fastened back with nails against the walls. I asked the reason of this, and they informed me that it was a hundred years and more since these doors were shut; all that time they had continued open day and night; strangers might arrive there at the most unseasonable hours, and in any numbers, for the master of the house had provided every thing necessary, both for the men and for their beasts; and he appeared with a delighted and joyful countenance when the guests tarried awhile;—and you cannot see any town or stage, or even desert, in Maweralnahr, without a convenient inn or stage-house for the accommodation of travellers, with every thing necessary." This flattering description, however, does not at all correspond with the accounts which we have of its present state; and we are afraid that it must be confined to an early part of its history, while one sovereign possessed the sole dominion of the country, and before the liberality of its inhabitants was extinguished, and their industry paralysed by the oppression of their conquerors. The Mahometan Tartars who possess Bucharia, have little to distinguish them from the most savage tribes. War and plunder are their chief employments, and slavery is practised among them in all its horrors. Expeditions are often undertaken for the sole purpose of procuring slaves, which they either keep in their service, or sell to their neighbours; and this commerce is carried to such a length, that they will frequently rob one another of their children to sell them, or even dispose of their own. If they are weary of their wives, they sell them, without ceremony, to the highest bidder, and do the

same with their daughters, particularly if they are beautiful. In short, they are indolent, perfidious, and cruel.

The climate of Great Bucharia is excellent, and preferable to any in the same latitude; the heats of summer being tempered by the breezes from the mountains with which it is surrounded, and whose lofty tops are continually covered with snow. The soil is equally favourable, and capable of producing every species of grain and fruits in the richest abundance. According to Ebn Haukal, the districts of Bucharia and Sogd constitute the most delightful country in the world; and from the Kohendiz, or ancient castle of the city of Buchara, such a scene of luxuriant and beautiful verdure presents itself on every side, that the spectator would imagine that the green of the earth was united to the azure of the heavens. "The walls and buildings and cultivated plains of Bucharia," says the same Arabian, "extending above thirteen farsang by twelve, and the Sogd for eight days journey, is all delightful country, affording fine prospects, and full of gardens, and orchards, and villages, corn-fields, and villas, and running streams, reservoirs and fountains, both on the right hand and on the left. You pass from corn-fields into rich meadows and pasture-lands, and the fruits of Sogd are the finest in the world."

Nature has refused nothing to this fine country, that can render it a most agreeable place of residence. The vallies are exceedingly fertile in all kinds of fruits and herbs; the rivers are abundantly stocked with excellent fish; and wood, which is in general such a scarce article throughout Great Tartary, is here as common as in most other countries. "In one word," says Bentick, "it is the richest soil in all Northern Asia; but few of its advantages can be appreciated by its Tartarian inhabitants, whose idleness is so excessive, that they would rather undertake a pillaging excursion into the territories of their neighbours, than bestow a moderate portion of their labour on the cultivation of those gifts which nature has so liberally conferred upon their own. In some parts, however, rice and other grains are cultivated to a considerable extent, but agriculture in general is here very imperfectly understood. From this circumstance, very little corn is produced in Bucharia. The most fertile parts of the country being always in pasture, upon which they rear an immense quantity of sheep and horses; and, according to Pallas, 10,000 horses, and 60,000 sheep, from this country, are annually sold at Orenburg, in Russia. Most of the mountains of Bucharia abound with the richest mines. Those of Badakshan, in the province of Balk, produce balay rubies, lapis lazuli, amianthis, and the precious metals; those of Fergana, vitriol, iron, copper, quick-silver, gold, and turkois. The inhabitants, however, have neither perseverance nor industry sufficient to profit by them, but content themselves with gathering the grains of gold and the precious stones which have been washed down by the torrents from the mountains when the snow melts in the beginning of summer.

Commerce is chiefly confined to the Buchars, who have always been considered as a trading people. They carry on a considerable traffic with China, Russia, Tibet, the Calmucks, and Mongales; and their caravans travel through the whole continent of Asia. Commerce, however, is very much shackled by the tyranny of the khans and their officers; and what is still more detrimental to it, their caravans are continually exposed to the attacks of the wandering Tartars. But notwithstand-

ing these impediments, they find their way to most of the capitals of the neighbouring kingdoms. They have several establishments in the southern provinces of Russia, with which they maintain a constant communication, and not only furnish them with their own products, but also with the merchandize of the eastern countries with which they trade. They send thither gold and silver, chiefly in Persian coins and Indian rupees; gold dust, precious stones, lapis lazuli, cotton stuffs, half silks, nitre, sal-ammoniac, rhubarb, and great droves of sheep and horses; for which they receive in return, cloth, leather, hardware, beads, indigo, cochineal, and furniture for their horses. To Pekin they carry large cornelians of a beautiful red colour, rough diamonds and other kinds of jewels, also gold dust and musk; which they exchange for fox and beaver skins, sable and other furs, damasks, cotton, and European cloths. They buy also tea, tobacco, and great quantities of earthen ware. The towns of Bucharina are also frequented by the merchants of Russia, Persia, India, and the northern provinces of China; but the merchandize which they bring there is very inconsiderable, and they sometimes even remain two years before it is disposed of. Persian coins are current in this country, and the highest piece of money that is struck in Bucharina, is the *tanga*, equal nearly to a crown of our money. It is of very fine silver, round, having the name of the khan on the one side, and on the reverse the name of the country, with the year of the hegira. The other coins are small brass pieces of different values.

The early history of this country is involved in great obscurity and uncertainty, particularly for some centuries after its subjugation by the Scythians; and for an account of the transactions in which it was engaged before that period, we refer our readers to the articles BACTRIA and SOGDIANA. The Scythians first took possession of Bucharina about 120 years before the Christian æra; and their kings held the dominion of this country during the reigns of the Roman Emperors Adrian, Antoninus Pius, and Valerian. They were, however, expelled in their turn, by a division of the Huns, who, being driven from their native seats in the north, by the arms of the Sicipe and the policy of the Chinese, sought in the western world for some remote country, inaccessible to the power of their inveterate enemies: (See HUNS.) Before the end of the first century, they had established their dominion in Sogdiana, where they still preserved their original appellation, with the epithet Ephthalites, or Nephthalites. By a long residence of twelve centuries in this mild and fertile country, and by their conversion to the religion of Islam, their manners had been softened, and their features insensibly improved; and the white Huns, as they were called, from the change of their complexions, had forgot the servitude and the pastoral life of their ancestors. Their king lived in all the splendour, and enjoyed all the authority of an eastern monarch, and his power extended from the Persian Gulf to the borders of India and Turkistan. Wealthy and populous cities pervaded the whole of Maweralnahr, and supplied him with a powerful army; and their bravery and discipline established him the first of the Moslem princes. But in the beginning of the thirteenth century, the pride and cruelty of Sultan Mohammed hastened his downfall, and the destruction of his country. A caravan of three ambassadors, and one hundred and fifty merchants, had been dispatched by the great Zengis, Emperor of the Moguls, to establish a

friendly and commercial intercourse with the sovereign of Bucharina. His offer was rejected with scorn, and his caravan arrested and murdered at Otrar, by the command of Mohammed. Zengis knew the strength and discipline of his enemy; and it was not till after a demand and denial of justice, that he determined to revenge the insult offered to his person and to his subjects. Seven hundred thousand Moguls advanced to the reduction of Bucharina, and encountered on the plains of Turkestan the army of Mohammed, consisting of 400,000 Moslems. The first battle was suspended by the night; but the Moslems were routed, with the loss of 160,000 soldiers. The native fierceness of the Moguls was exasperated by the pretence of justice, and the incensed Zengis indulged the rapine of his followers. The strongest cities were unable to withstand their fury. They overran and desolated a tract of many hundred miles, adorned with the habitations and labours of the Bucharians; and the country received the name and the dominion of Zagatai, the second son of the Emperor Zengis.

For more than a century, the successors of this prince reigned in Bucharina; but the extinction of the royal line, and the domestic feuds of the emirs, offered their country an easy conquest to the khan of Cashgar, who, with an army of Calmucks, soon established his dominion in Maweralnahr. His success, however, was but of short duration. Tamerlane had appeared at the head of the Bucharian emirs, and, after expelling the Calmucks from his country, was invested, in a general diet, with the imperial command, and seated on the throne of Zagatai. In secure possession of a great empire, Tamerlane disdained the repose of peace; and though he laboured to cultivate and adorn the country of his birth, yet the restless energies of his mind found their suitable employment only in desolating and subduing the nations of the earth. He soon united to his empire the countries of Kharism and Candahar, and turning towards Persia, he did not stop until he had reduced twenty-seven kingdoms to his authority, and established Samarcand the first capital of the world. Indulging in a short repose from the toils of conquest, he employed his riches in the building of palaces and temples, and he displayed his magnificence and power to the ambassadors of Tartary, India, Egypt, Arabia, Persia, and Spain. But China was still unsubdued; and the aged monarch, with a select army of 200,000 veteran soldiers, again unfurled his standard for the invasion of that distant kingdom. The severity of winter could not retard his departure. He passed the Sihon on the ice, and after marching 300 miles from his capital, pitched his camp for the last time in the neighbourhood of Otrar. A fever, with which he had been seized on his journey, was accelerated by cold and fatigue; and the conqueror and scourge of Asia expired in his tent, in the seventieth year of his age. His death arrested the expedition; China was saved; and with his life expired the glory of Samarcand. His children were unable to uphold such a mighty empire. They soon became the enemies of each other, and the oppressors rather than the protectors of the people; and before the end of a century, the descendants of Tamerlane were expelled from Bucharina by the Usbeck Tartars, who, in 1494, founded a powerful monarchy in that country. Successive princes wielded the sceptre from 1494 to 1658, when this extensive and fertile kingdom was soon after broken into several governments, under numerous khans; in which state,

according to the latest information which we have been able to collect, it still remains.

The principal cities of Bucharina are; Samarcand, Buchar, Balk, Badakshan, Orushna, Kotlan, Termed, Anderab, and Gaur. See Peuchet *Dictionnaire*, &c.; Pinkerton's *Geography*, vol. ii. p. 468; *Recueil de Voyages au Nord*, tom. x. p. 127; and Gibbon's *Rom. Empire*, vol. iv. xi. xii. (p)

BUCHARIA, (LITTLE,) a country of Asia, formerly called the kingdom of Cashgar, and supposed to be the *Serica* of Ptolemy, and the *Scythia extra Imaum* of the ancients. It received the name of "Little," not from its being less extensive than Great Bucharina, but from its being much inferior to that country, both with regard to its soil, its climate, its population, and the number of its cities. It is almost surrounded with mountains and deserts. On the west, it is separated from Great Bucharina by the mountains of Belur; on the north, from Soongaria and the Calmuck Tartars by the Altaian mountains; on the east, from the empire of China and the Eluts of Kokonor by the desert of Cobi; and from Tibet, on the south, by the mountains of Mus Tag. It extends about 1000 British miles in length, and its greatest breadth is nearly 500; being comprehended between 36 and 44 degrees of north latitude, and 70 and 88 degrees of east longitude. This country, when visited by Goetz, was divided into two kingdoms; that of Cashgar on the west, and Chialish on the east; but these states compose only the northern and western parts of Little Bucharina; and the southern parts contain several large provinces, such as Koton and Karia, the former of which is represented by Strahlenberg as an independent kingdom. Whatever is said, however, concerning the geography of this part of Asia, must be received with very great allowance; for neither its extent, its divisions, nor its population, nor even the names of its cities, and the sources and course of its rivers, have ever been ascertained with any degree of accuracy. Its principal rivers are, Yarkand, which is represented as issuing from Loch-nor Lake, and passing through the deserts, nearly in a straight line of not less than 500 English miles, and supplying several branches, as the Koton, Orankash, &c.; the Chaidu, which proceeds from the same lake; and the Karia, which has its source in a lake in the desert of Sultus.

From the general elevation of the land, and its lofty mountains, rising from the midst of sandy deserts, this country resembles a sea interspersed with rocks and islands; and though the climate is much colder in winter than might be expected from its latitude, yet, in summer, the heat is so concentrated by the surrounding mountains, that out of doors it can scarcely be endured. The soil is in general barren, though interspersed with some fertile vallies, which produce cotton, hemp, flax, wines, and various kinds of fruits; and the mountains are rich in gold and silver mines, but both the Calmucks and Buchars are equally ignorant of the method of working them, and content themselves with gathering the gold dust which is washed down by the rivers, and with which they carry on a trade with India, China, and Siberia. This country also abounds with diamonds and other precious stones, but as the inhabitants have not the art of cutting or polishing them, they are sold in their rough state. The Calmucks, who wander about this country, live in tents, and almost entirely upon the produce of their cattle (See CALMUCKS); and the Buchars, who compose the greatest part of its popu-

lation, inhabit the cities, and employ themselves in trade and merchandise. These differ very little from the inhabitants of Great Bucharina. Their manners, their dress, and their appearance, are nearly the same, except that the former are rather of a darker hue, arising probably from the reflected heat of the sandy deserts; and the women wear a greater profusion of ornaments, and dye their nails with *henna*. Their habitations are generally built of stone; and their furniture consists chiefly of trunks plated with iron, which are ranged along the walls, and covered, during the day, with mattresses, which at night are removed and used as beds. They use neither tables nor chairs, but sit cross-legged on the ground, and eat their meat, which is placed upon a cloth, with their fingers or wooden ladles. Their food consists chiefly of small cakes, composed of minced meat, which will keep a long time, and of which they make a very palatable soup during their long journeys in the deserts; and their principal beverage is tea, which they prepare with milk, butter, and salt. Though the prevailing religion of the country be Mahometanism, yet the Calmucks, who are represented as plunged in the grossest idolatry, allow the greatest toleration; and no person suffers on account of his opinions. The Buchars, however, are very superstitious. Both sexes carry about with them prayers written by their priests, which they keep in a small purse in the form of relics. In sickness, the occupation of the physician is merely to read to the patient a sentence from some book, to breathe on him several times, and to wave across his face a sharp-edged knife, which is supposed to cut the root of the disorder. When dead, the priest lays the Koran on his breast, and recites some prayers, immediately before the body is interred. Though polygamy is considered by the Buchars as unlawful, yet it very generally prevails. Their wives are purchased from the father, so that daughters are in this country a real treasure. All intercourse, however, between the betrothed couple is prohibited from the signing of the contract to the celebration of the marriage; and they are even forbidden to see one another during the performance of the ceremony. The Buchars are rather a polite and benevolent people, never intermeddling with the affairs of war or conquest, but paying quietly the annual tribute demanded of them by their conquerors. Their principal commercial intercourse is with China, where they carry gold dust, musk, rough diamonds, and precious stones, which they exchange for tea, tobacco, and European cloths. They also export these articles to Persia, and sometimes as far as Tobolsk in Siberia. The only coin they have is the *Kopeik*, which is made of copper, and weighs about a third of an ounce; but all considerable sums are paid in gold or silver, which they weigh, after the manner of the Chinese and their other neighbours.

Little Bucharina, in ancient times, was the country of the "Seres;" but very little is known of its history, until its conquest by Zengis Khan, who bequeathed it, along with Great Bucharina, to his son Zagatai; and it continued to follow the fortunes of that country till 1683, when it was conquered by the Calmucks. Under the dominion of their Contais, or Great Khan, the dependencies of Bucharina had extended over the provinces of Turfan and Hami, and east of the desert of Cobi as far as the great wall of China. Of this country they remained in quiet possession until 1715, when the jealousy of the Chinese, and the animosity of the Mopgals, were raised

by the discovery of a gold mine at the foot of the mountains which separate the territories of the two kingdoms. The Contaish had dispatched a body of 10,000 Calmucks to seize upon this treasure; but, being attacked by the Mongales and Chinese, were completely routed, and pursued into the deserts, which they, however, re-passed, by certain fertile vallies, scattered among the mountains, which till then had been entirely unknown to their enemies. The Chinese emperor, wishing to profit by his success, sent a powerful army, well furnished with artillery, under the command of his son, attended by a Jesuit of Pekin, well skilled in the science of fortification and gunnery. This prince passed the deserts by the same route which the Calmucks had taken in their flight, and entered the extensive plains of Turfan and Hami; but, being unwilling to risk his army in such an open country, against the cavalry of the Contaish, who had advanced to meet him, he contented himself with erecting a chain of forts, which he supplied with cannon and infantry. Under the protection of their forts, the Chinese kept possession of these provinces, without the Calmucks being able to bring them to an engagement. The Contaish, who now saw that it would be impossible to drive out the Chinese without the aid of cannon, with which his subjects were entirely unacquainted, was compelled to have recourse to Russia. He offered, in 1720, to pay an annual tribute to that power, upon condition that it would supply him with an army of 10,000 regular troops, well equipped with cannon, to enable him to meet the Mongales and Chinese; but Peter the Great, who was at that time engaged in a war with Sweden, and also prosecuting his plans of conquest on the side of Persia, was prevented from accepting such advantageous proposals. The Chinese, consequently, remained masters of these provinces, with all the territories of the Contaish, east of the desert of Cobi, towards the frontiers of China. The Calmucks, irritated by their losses, became the most determined and dangerous enemies of the Chinese empire; and though its monarch had made repeated visits into Mongolia to overawe their restless neighbours by a display of superior power, yet they continued their hostile ravages whenever an opportunity could be found of harassing their enemies, until they were completely subdued by Kiang Long in 1759, who thus extended the limits of his empire as far as the mountains of Belur.

The principal cities of Little Bucharia are, Cashgar, Yarkand, Koton Karia, Chialish, and Turfan. See Pinkerton's *Geography*, vol. ii. p. 252; Peuchet *Dictionnaire*, &c.; *Recueil de Voyages au Nord*, tom. x. p. 113; and Astley's *Collection of Voyages*, vol. iv. (h)

BUCKING. See BLEACHING.

BUCKINGHAM, the principal town of Buckinghamshire, is situated on the side and bottom of a hill, on the river Ouse, which winds round the three sides of the town, and is crossed by three stone bridges. The houses, which are chiefly of brick, are ill built, and many of them are thatched. The town consists of one long street, and the buildings are irregularly scattered over a large space of ground. The principal public edifices are, the church and the town hall. The former of these is erected upon the summit of an artificial mount, which was formerly the site of a castle. This elegant

fabric, which was begun in 1777, and finished in 1781, at the expence of 7000*l.* is built of stone, and the beautiful square tower attached to its south-west end, is adorned with pinnacles and embrasures, and with a light tapering spire 150 feet high. The old church fell in 1776; its spire, which was the tallest in England, having been blown down so early as the year 1698. The inside of the church is fitted up like Portland chapel in London. The seats are all of oak wainscoting, and the altar-piece is a tolerably good copy of the transfiguration by Raphael. The area about the church is formed into a pleasant walk, planted with trees, and commanding a view of the serpentine course of the Ouse. The town-hall is a large brick building, surmounted with a gilt swan, which is the burgh arms. The principal floor is kept for the magistrates, when they hold the parish court and sessions. The jail, which is built in the form of a castle, is appropriated chiefly for those who have committed offences in the town and parish. The free school, founded in 1540 by Isabel Denton, has been increased by several donations. All the business of the county was formerly transacted at Aylesbury, but, by a late act of parliament, the summer assizes were brought back to Buckingham in 1758. The inhabitants of Buckingham are principally employed in agriculture and in lace-making. The women, who are engaged in this manufacture, make from eighteen pence to two shillings a day; but the establishment of a lace-manufactory at Nottingham, where it is made by machinery, has considerably injured the retail trade in this place. The principal sort of lace which is made, is fine black and white thread lace. There are a few corn and paper mills upon the Ouse. In the time of Edward III., one of the staples for wool was fixed here; but the trade being removed to Calais, it soon declined; and, in the reign of Henry VIII., Buckingham was one of the decayed towns which was relieved by act of parliament. In the year 1724, no fewer than 138 houses were consumed by a dreadful fire, which occasioned a loss of 40,000*l.* Number of houses, 531. Population, 2605; of whom 313 were returned as employed in trade and manufactures. See Willis's *History and Antiquities of the Town, Hundred, and Deanery of Buckingham*; Penant's *Tour*; Maton's *Tour*; and the *Beauties of England and Wales*, by Brayley and Britton, vol. i. p. 280. (x)

BUCKINGHAMSHIRE, one of the inland counties of England, is bounded on the south by Berkshire and a point of Surrey, from which it is separated by the Thames; on the west by Oxfordshire; on the north by Northamptonshire; and on the east by the counties of Bedford, Hertford, and Middlesex.

Camden is of opinion, that the name of this county is derived from the Saxon *Bucken*, indicative of the beech trees with which the county was formerly covered; while Spelman and Willis affirm, that it is derived from *Buccen*, signifying bucks or deer, with which the forests of the county were at one time stocked.

The Chiltern Hills and their appendages, occupy the southern parts of Buckinghamshire, which is elevated, healthy, and pleasant. These eminences are principally composed of chalk, intermixed with flints; and, as the soil is very shallow, with a chalk bottom, the flints are regarded as necessary for keeping the surface moist, and protecting the grain from the too powerful effect of the sun. On this account, the farmers do not attempt to clear the soil of these stones; but in many cases they

are rather anxious to increase than diminish their number. The soil in this part of the county is very much inferior to that of the northern district, though it is extremely productive, from the attention which is paid to the cultivation and improvement of the land. The lightness of the soil calls forth the utmost activity on the part of the farmer. Every material that can be employed as manure, is carefully collected, and judiciously applied; and every improvement in agriculture is readily adopted. The extensive and prolific vale of Aylesbury occupies the centre of the county, and furnishes a rich pasturage to vast quantities of cattle. The dairy and grazing systems are chiefly followed in this part of the county, the amazing fertility of which was known in the days of Drayton, who mentions it in the following lines :

"Aylesbury's a vale that walloweth in her wealth;
And (by her wholesome air continually in health)
Is lusty, firm, and fat, and holds her youthful strength."

The wonderful fertility of the soil about Aylesbury and Buckingham, where the meadows bring forth their produce almost without exertion, has generated among the farmers a remarkable degree of indolence and inactivity. They considered it as a disgrace to suffer a heap of manure to be seen at one end of their field,—to plough in straight lines,—to disturb an ant-hill on his pastures,—or to permit more water than falls from the heavens to pass over their meadows. The fine brooks and rivulets which flow through the meadows, are allowed to pursue their course unused; and, excepting in the neighbourhood of one or two of the paper-mills, there is scarcely an acre of land irrigated through the whole county. The northern parts of Buckinghamshire are diversified with gentle sand hills, which enter it from the county of Bedford.

The soil of this county is composed chiefly of rich loam, strong clay, chalk, and loam upon gravel. Wheat, barley, oats, beans, and sainfoin, are the principal articles of produce in the Chiltern district. Only a small part of the northern division of the county is arable. The great quantity of butter which is made annually on the pasture and meadow farms, is chiefly sold to the London dealers, who contract for it every half year. Eight pounds (sixteen ounces to a pound) is the average weight of butter produced weekly from each cow in summer; while six pounds is the average weight in winter. A mill churn, wrought by a horse, has been lately introduced into some of the dairies, to facilitate the operation of churning. In other dairies, a barrel churn is used, wrought by two men, who make from six to six score pounds of butter at one churning. The scum and butter-milk are employed for the purpose of fattening swine. Calves are suckled in great quantities in the neighbourhood of Medmenham and Great and Little Hampton; and, at the town of Aylesbury, and in its vicinity, the rearing of ducks for the supply of the London market is an object of great attention. By a restriction of food, and by other artificial means, the ducks are prevented from laying till the months of October and November; and, for some weeks previous to this period, they are fed with stimulating provisions; and when the eggs are ready, a hen is employed to sit, and is frequently obliged to continue in the nest till three successive broods are hatched. Exhausted with this duty, the animal often dies as soon as it is perform-

ed. When the young escape from the shell, they are nursed with particular care at the side of a fire; and by such artificial and unnatural means, ducklings are sent at Christmas to London, where they have sometimes been sold from fifteen shillings to a guinea a pair.

In the agricultural operations of Buckinghamshire the labour of horses is preferred to that of oxen. The heavy quality of some parts of the soil, and the flintiness of other parts, have induced the farmer to decide in favour of the former. The swing and high wheel ploughs, drawn by four horses, two abreast, are principally in use in the southern parts of the county; while the loose-handle swing, and low wheel ploughs, wrought by five or six horses in a line, are generally employed in the northern division. The nature of the leases in Buckinghamshire is a very considerable obstruction to agricultural improvement. The tenants are confined to two or three crops and a fallow, and they are prohibited to grow clover and green food.

The manures chiefly employed in this county are, marl, peat-ash, yard and rabbit dung. Hair and hoofs are strewn with great advantage on the strong and cold soils; and the wheat and young clover are greatly invigorated by the application of soot and ashes.

The rents of farms vary, in general, from 60*l.* to 250*l.* a-year; a few rents are as high as 500*l.*, and two or three rent at 1000*l.* The commons were estimated at 91,900 acres, but a very considerable proportion of these are now inclosed. The heaths of Iver, Fulmer, Stoke, and Wycombe, along with the other waste lands, do not exceed 600 acres. Great quantities of fine beech trees are produced in the southern part of the county; and nearly the sixth part of the ground between the Thames and the road to Oxford is covered with that wood. Numerous plantations of Scotch firs are thriving on Wavendon heath, which is now the property of the Duke of Bedford, and which was inclosed in 1778. In the coppices of Whaddon-chase there are many fine oak and ash trees.

The principal manufactures of Buckinghamshire are lace and paper. Almost all the lower classes of females in the county are employed in lace-making; and there is scarcely a house in which there is not a lace-pillow, parchments, bobbins, gimps, pins, thread, and other requisites for that manufacture. It is said, that more lace is manufactured in the town and neighbourhood of Newport Pagnell than in all the rest of England. A market is held every Wednesday for the purpose of selling this article; and great quantities of it are disposed of at the fairs, of which no fewer than six are held annually. The manufacture of paper is carried on to as great an extent in the neighbourhood of Wycombe, as in any other part of England. There are no fewer than fifteen corn and paper mills on the part of the small river Wycombe which passes through the parish. At Amersham there is a cotton manufactory, established about twenty-two years ago, which employs above 100 persons, though a considerable part of the business is performed by machinery. Wooden articles, in the respective branches of round, hollow, and Tunbridge-ware, are manufactured at Chesham.

The antiquities of the county are not very numerous. Stony Stratford, or its immediate vicinity, has been regarded by several antiquaries as the *Lactodorum* of the Itinerary: Considering that the etymology of *Lactodorum*, in the British language, perfectly agrees

with its present English name,* Camden supposes the particular spot occupied by the Roman station to have been at this town, though Dr Stukely places it at Old Stratford, and Dr Salmon at Calverton. The ancient church of Stewkely is of Saxon workmanship, and is mentioned by Dr Stukely as the oldest and most entire he ever saw. The date of 1106 is said to have been observed on a stone by some workmen who were repairing the roof of the chancel. The cross, built upon the side of a high, steep, and chalky hill, near the hamlet of Whiteleaf, is supposed by Mr Wise to have been erected in the reign of Edward the Elder, in commemoration of a battle fought against the Danes. It is about 100 feet high, and 50 broad, tapering to 20.

In the neighbourhood of Wycombe, in a meadow on the grounds at Loakes, there was found, in 1724, a tessellated pavement, about nine feet square, with the figure of a wild beast in the centre. The borders are curiously ornamented with small square stones of different colours. The coins discovered along with it were those of Antoninus Pius and Marcus Aurelius. A Roman vessel was found on digging in the High Street of Wycombe; and several Roman coins have been found in the neighbourhood.

The chief rivers of Buckinghamshire are the Thames and the Ouse. The Thames rises in the county of Hertford, near the borders of Buckinghamshire; and after flowing, from east to west, through the vale of Aylesbury, it is enlarged by the waters of several tributary streams, and enters the county of Oxford near the town of Thame. The Ouse enters Buckinghamshire on the western side, and, after passing Water Stratford, and Buckingham, it winds to the north through a rich tract of meadow land, and pursues its course to Stony Stratford, Newport Pagnell, and Olney. After turning suddenly to the east, it leaves the county near Brayfield.

The trade of this county has been greatly facilitated by the Grand Junction Canal, which enters it near Woolverton, and, after running eastward within a mile of Newport Pagnell, it flows to the south, and passes Fenny Stratford, Stoke Hammond, Linslade, and Ivinghoe, and enters Hertfordshire near Bulbourne. A cut, called the Navigable Feeder, has been made from the canal at Bulbourne to Wendover, and another from Old Stratford to Buckingham.

The county of Buckingham is about 45 miles long, 18 broad, and 138 in circumference. It contains about 518,400 acres of land, of which 352,000 are stated to be arable, and about 170,000 acres pasturage, with about 5000 acres of waste ground fit for cultivation. The number of houses is 20,443, and the population 107,444. The number of males is 52,094, and the number of females 55,350; of whom 25,083 were returned as employed in agriculture, and 20,138 as engaged in trade, manufactures, and handicrafts.

There are 185 parishes in Buckinghamshire, and 15 market towns, viz. Buckingham and Aylesbury, the county towns, Amersham, Beaconsfield, Chesham, Colnebrook, Ivinghoe, Newport Pagnell, Olney, Risborough, Stony Stratford, Wendover, Wycombe, Winslow, and

Great Marlow. It is divided into eight hundreds, viz. Ashenden, Aylesbury, Buckingham, Burnham, Cottesloe, Desborough, Newport, and Stoke. It sends fourteen members to parliament: two from the county, two from Buckingham, two from Aylesbury, two from High Wycombe, two from Amersham, two from Wendover, and two from Great Marlow. With the exception of six parishes belonging to the see of Canterbury, and four in the diocese of London, the whole of the county is in the diocese of Lincoln. It is in the Norfolk circuit, and pays twelve parts of the landtax, and furnishes the militia with 560 men. The poor's rates have been augmented to 22s. in the pound.

The magnificent mansion and grounds of Stowe, the seat of the Marquis of Buckingham, form the principal ornament of the county. When viewed from a distance, they appear like a vast grove, interspersed with columns, obelisks, and towers, which seem to emerge from a luxuriant mass of foliage. The pleasure grounds occupy 400 acres; and the mansion contains a collection of the finest paintings, and a very choice and spacious library.† The other principal seats in the county are, Gothurst, the seat of George Wright, Esq.; Liscombe House, the seat of Sir Jonathan Lovat; Wotton-under-Bernwood, the seat of the earl of Temple; Chiquers, the seat of Sir John Russel, Bart.; Chalfont House, the seat of Thomas Hibbert, Esq.; Shardeloes, the seat of T. D. Tyrwhitt Drake, Esq.; Wycombe Abbey, the seat of Lord Carrington; Hitchenden, the seat of the Countess Dowager Conyngham; Wycombe Park, the seat of Sir John Dashwood, Bart.; Fawley Court, the seat of Strickland Freeman, Esq.; Danesfield, the seat of Robert Scott, Esq.; Harleyford, the seat of Sir William Clayton; Hedsor Lodge, the seat of Lord Boston; Wilton Park, the seat of James Du Pre, Esq.; Bulstrode, the seat of the duke of Portland; Slope Park, the seat of John Penn, Esq.; and Taploe House, the seat of the Marquis of Thomond. See Langley's *History and Antiquities of the Hundred of Desborough*, 4to, 1772; *The Beauties of England and Wales*, vol. i. p. 276.; *The General View of the Agriculture of Buckinghamshire*; Pennant's *Tour from Chester to London*, 1782; Bray's *Tour in 1783*; and Shaw's *Tour in 1789*. For some account of the strata of Buckinghamshire, and of the pits of fullers' earth in Wavendon, see the article BEDFORDSHIRE. (π)

BUCKLER. See ARMOUR.

BUCQUET, JOHN BAPTISTE MICHAEL, a celebrated chemist, was born at Paris on the 18th of February 1746. After distinguishing himself in the course of his education at school, he was sent by his father, who was an advocate, to study the profession of the law. His attention, however, had not been long directed to this subject, when it was attracted to the study of the sciences, and his time was henceforth devoted to chemistry, medicine, and anatomy. Having attended the lectures of the most celebrated teachers, and spent a great part of his finances in the acquisition of knowledge, he resolved to become a candidate before the faculty of medicine, for a licence, free of expense, which is always given to the most deserving at the opening of every session. Though Buc-

* Both of these are derived from the stones and fords across the rivers.

† For a full account of these, see the *Description of the House and Garden of Stowe*, 8vo, 1797; and Brayley and Britton's *Beauties of England and Wales*, vol. i. p. 285.

‡ "I am told," says Mr Pennant, "that the great snail, or *Pomatia*, is found in the neighbouring woods, which is its most southern residence in this island. It is of exotic origin, and, according to tradition, was introduced by Sir Kenelm Digby, as a medicine for the use of his lady."

quet was not the successful candidate, yet he never lost sight of the object of his ambition, and, by the assistance of his friends, he was soon enabled to defray all the expence of a regular licence, at the end of which the first place was assigned to him by the faculty. The lectures on chemistry and natural history, which he now began to deliver, were numerous attended. By his eloquence as a public speaker, and the interest which he contrived to throw upon every subject which came under his review, he attracted to his lectures all ranks of society, and widely extended his reputation as a philosopher.

In order to assist the students who attended his lectures, he published in 1771, in 2 vols. 12mo, his *Introduction a l'etude des corps naturels tirés du regne mineral*; and in 1773 appeared his *Introduction a l'etude des corps tirés du regne vegetale*.

In the year 1775, Bucquet was appointed to give lectures on Pharmacy; and upon the death of M. Roux, in 1776, the Faculty of Medicine unanimously appointed him professor of Chemistry, and his first course of lectures was delivered in 1777.

Having now the command of a more extensive laboratory, our author directed his attention to his favourite study; and the results of his chemical researches were read before the Royal Academy of Sciences. His first memoir, entitled, *Experiences physico-chimiques sur l'air qui se degage des corps dans le tems de leur decomposition*, &c. was published in the 7th volume of the *Memoires des Savans Etrangers*, and contains a series of excellent experiments on the proportion and effects of fixed air. By working, however, with two small quantities, he fell into some mistakes respecting the specific gravity and the acidity of that gas. His second memoir, entitled *Memoire sur quelques circonstances qui accompagnent la dissolution du sel ammoniac par la chaux*, &c. was presented to the academy in 1773, and published in the ninth volume of the *Memoires des Savans Etrangers*, p. 563. In the same volume he has likewise published *Memoires sur plusieurs combinaisons salines de l'arsenic*. The celebrated Duke de la Rochefoucault and M. Bucquet made a number of joint experiments on the analysis of zeolite. They obtained from it a good deal of water, and the residue, formed with vitriolic acid and salt, arranged in small needles, from which they concluded that zeolite is not a volcanic product, and that it contains a particular earth analogous to magnesia. (See the *Mem. Sav. Etrang.* tom. ix.) The attention of M. Bucquet was next directed to the analysis of blood. His memoir upon this subject, which is said to be a model of precision, was read before the academy on the 11th of May, but has not yet been given to the public. These researches were followed by a series of experiments, made along with M. de la Plache, on the best method of preparing the different kinds of æther, but particularly the muriatic and the nitrous. The memoir in which these experiments are detailed has not yet been printed.

The talents of M. Bucquet were now joined to those of the celebrated Lavoisier, for the purpose of verifying the fundamental experiments of the animal kingdom. These distinguished chemists have settled a number of uncertain facts on the progress of heat, and on the nature of acids and gases. They repeated many experiments which required intense heat, and a very complicated apparatus; and the result of their labours was drawn up in 15 articles, which were presented to the Royal Academy of Sciences.

In the memoirs of the Royal Society for 1776, p. 377, M. Bucquet published an analysis of opium, and in the same volume he has given the abridgment of a memoir, which was afterwards published separately in an enlarged form, under the title of *Memoire sur le maniere dont les Animaux sont affectés par differens fluides aeriformes mephitiques et sur les moyens de remedier aux effets de ces fluides; precedé d'une histoire abregée de ces differens fluides aeriformes ou gaz*. 8vo. 1778.

During all these occupations, M. Bucquet found sufficient leisure for the practice of medicine. His reputation as a lecturer, induced many of the most opulent persons in Paris to employ him as a physician, and from constantly associating with that class of society, he acquired too great a predilection for the manners and luxuries of the great.

This mode of life contributed, probably, along with his severe application to study, and his extreme sensibility, both of body and mind, to bring upon him those bodily sufferings which embittered the last years of his life. A dreadful depression of spirits, and an obstinate watchfulness, deprived him of that rest which was necessary to his exhausted frame; and he was frequently obliged to rise in the middle of the night, and fix his mind upon some particular subject, in order to withdraw it from the impulses of a vigorous imagination, which overwhelmed him with too rapid a succession of objects. In April 1779, he was attacked with the most alarming convulsions, and fainting fits, which greatly reduced his bodily strength; but, in spite of his extreme debility, his ardour for the sciences made him resolve to give his course of chemical lectures at the Faculty of Medicine. The heroism with which he fulfilled this resolution, is perhaps unparalleled in the history of science, and scenes more truly affecting were perhaps never witnessed, than those which occurred during the delivery of his last course of lectures. When the hour of lecture approached, the cries wrung from him by bodily pain gradually subsided; his countenance assumed a serene aspect; he tore himself from his bed, and repaired, with a tottering step, to his amphitheatre. In the course of his lecture his utterance was alternately hastened and interrupted, by the excruciating torments which he suffered, and he was often seen to press himself against the table of his laboratory, to smother the cries of an unsufferable agony, without ever losing sight of the subject of his lectures. His pupils listened to him with affection and admiration, and, with their eyes bathed in tears, they received the last words of a master whom they esteemed and loved. When this course of lectures was completed, a settled melancholy preyed upon the mind of Bucquet: he saw that his talents could no longer be exerted, and that the short period which he had to live must be a period of unexampled suffering. To relieve his bodily agonies, he often took a pint of æther, and more than a hundred grains of opium in a day, but he did not long sustain these violent excitements. He died on the 24th of January 1780. The principal seat of his disorder was in the colon, which was obstructed, schirrous, and ulcerated. His stomach, and other intestines, were inflamed and softened by the effects of æther. (o)

BUD. See BOTANY, Part II. p 52.

BUDA, the *Acinium* of the Romans, the capital of the circle of Pest, and metropolis of Hungary, is beautifully situated on an eminence on the west bank of the Danube, about 125 miles south-east of Vienna, and 150 north-

west of Belgrade. It is supposed to have received its name from Buda, the brother of Attila: this, however, seems only to be the Turkish name, as it is called *Offen* by the inhabitants, and throughout Germany. On the opposite side of the river stands Pest, the *Contra Acinium* of the Romans, which is connected with Buda by a bridge of boats across the Danube, above 300 yards in length, and consisting of 63 large pontoons. In statistical descriptions, they are in general considered as one city, and are spoken of in the same way as we do of London and Westminster. The city of Buda has neither fortifications nor gates. The castle stands at the extremity of the hill towards the east, and commands the greatest part of the city. It is encompassed with a deep moat, and is defended by an old-fashioned tower, and other fortifications. The suburbs, or "Jews town," extends from the city to the Danube. The houses are mostly built of square stones, but the whole town has an ancient and sombre appearance. When Buda was the residence of the sovereign, in conjunction with Pest, it formed the largest and finest city of Hungary. But while it was under the dominion of the Turks, who possessed it above 150 years, its best buildings were suffered to fall into decay. Of the remains of these, the principal is the church of the Ascension of the Virgin Mary; and in their stead arose many mosques and minarets; several of which were, in their turn, destroyed in the last war by the German artillery. There is here a convent of Carmelite nuns, and several churches belonging to the Franciscans. It has also a considerable number of caravanseras and mosques, some of which are very elegant buildings; but the finest edifices of Buda are its warm baths, which vie with the most magnificent in Europe. These warm springs were considered by the Turks as the most valuable luxuries which they found in Hungary; and several remains of baths, built in the Turkish fashion, are still to be traced. They were generally circular rooms, of considerable dimensions, with cupolas closely perforated, and studded over with small hemispherical glasses. The baths of Buda have been long famous, and in many cases are esteemed specific. The water is impregnated with sulphur, glauber-salt, and iron; and the heat is 49 degrees by the thermometer of Reaumur. The chief public and private buildings, however, are in Pest, which, from being principally inhabited by foreign merchants, has more of the modern style in it, and of resemblance to other large towns. It is surrounded with a wall and moat, and contains the royal palace, which is a large and respectable edifice, a military hospital, six convents, and several churches. The university of Pest is the first school of learning in the kingdom. It was founded at Tyrnau in 1655, by Peter Pazmann, the primate of Hungary, who endowed it with 100,000 florins, and put it under the direction of the Jesuits. It was some time ago transferred to Pest, and, by the suppression of the Jesuits, and the confiscation of their property, its funds were increased to nearly half a million of florins. The original institution consisted only of schools for philosophy and theology; a school of law was added in 1667, and one for medicine in 1770, by the Empress Maria Theresa. The university at present is composed of 32 professors, besides assistants, independent of the theological classes; 6 for law, 10 for medicine, and 16 for philosophy. The school for theology is a Catholic seminary, under the inspection of the Archbishop of Gran. Instruction is here entirely gratuitous,

VOL. IV. PART II.

but the student must follow a certain course of study prescribed every year by the professors. Attached to the university is an observatory, which is situated at Buda; a library, a museum of natural history, of machinery, and of medals, which may be ranked among the fine collections of Europe; a theatre of anatomy, an hospital, and a botanical garden; and a printing-house, employing twelve presses, and fourteen compositors. Besides the university library and garden, Pest has a royal library, founded by Count Szeccseny, and enriched with many scarce editions, and valuable manuscripts, the gifts of several grandees, and learned Hungarians; and a royal garden, which is one of the richest in Europe, and contains a great number of exotic plants, which are cultivated with particular care.

Buda is the centre of Hungarian commerce, and the first commercial city in the kingdom. Public roads in every direction lead to the principal ports and cities of the neighbouring countries; and its chief exportations consist of the productions of the soil, and of national industry. Grain, tobacco, brandy, potash, honey, and wax, are here important articles of commerce, and the imperial Tokay wine, so famous at Buda, is often drunk for burgundy, and great quantities of it are sent to Germany, Russia, and Poland. This city is also the great staple for the woollen manufactures of the country. Its imports consist principally of Austrian manufactures, and a few from Turkey, as the Austrian government have prohibited the introduction of all other foreign merchandise, in order to encourage their own merchants. The manufacturing classes of Buda are in general composed of Germans, as a true Hungarian would think himself disgraced by being employed in any other occupation but in that of agriculture or of arms; so that the masons, joiners, watch-makers, and other artisans, are mostly natives of Germany. The fair of Pest is the greatest in Hungary, and lasts eight or ten days. The chief articles of sale are the natural productions of the kingdom, such as horses, which are driven to the market like flocks of horned cattle, and kept in folds; oxen, wool, hides, and earthen ware. Great numbers of Greeks, Jews, and Armenians, attend this fair, and indeed the great concerns of commerce are chiefly in their hands.

Buda was the residence of the Hungarian monarchs, till Sigismund became Emperor of Germany in 1410, and from the first appearance of the Turks in Hungary, this city continued to be the scene of contention between that people and the Imperialists, for more than a century. It was first taken by the Ottomans under Soliman I. in 1525, but was retaken by Ferdinand, Archduke of Austria, in the following year. The Ottomans, however, made themselves masters of it a second time, in 1529; and, in 1541, it was constituted the capital of a Turkish pachalik, composed of the neighbouring provinces; and notwithstanding the repeated attempts of the Austrians to regain it, it remained in their possession till 1686, when it was finally recovered by Prince Eugene, and confirmed to Leopold I. by the treaty of Carlowitz, in 1699. From that time it has remained under the dominion of the house of Austria. In 1784, the Emperor Joseph restored the seat of government from Presburg to Buda, and at the same time removed to Vienna the ensigns of royalty, consisting of a crown, a sceptre, a robe, and a pair of stockings, said to have been worn by St Stephen. But the removal of these regalia out of the kingdom, contrary to an express law of the land,

5 F

occasioned so much discontent and clamour, that they were returned, and are now secured in a vault at Buda.

From the public offices being transferred to Buda, this city acquired a great addition of wealthy inhabitants, by which the citizens were enabled to let their houses, and sell their wines and other produce, to greater advantage; and as a mark of gratitude to the Emperor Joseph, whose measures had been so conducive to their interest in this respect, they requested permission to erect to him a statue. But the Emperor saw the mean and selfish spirit by which they were actuated, and made the following memorable reply: "When prejudices shall be eradicated; when true patriotism, and just ideas of the general good of the kingdom, shall be established; when each, in an equal proportion, shall with readiness contribute his share to the wants of the state, its safety and prosperity; when true enlightening knowledge, improved studies, simplicity in the teaching of the clergy, and the union of true ideas of religion with the laws of society; a solid justice; riches, through increased population and improved agriculture; acknowledgment of the true interest of the landlord towards his peasants, and of those towards their landlord; when industry, manufactures, and the demand of them, and general unanimity amongst the provinces of the monarchy, shall be introduced, as I wish and hope, then I merit a statue: but not where the city, by my transferring thither the public offices, for a more easy inspection, obtains a greater consumption of its wines, and a higher rent of its houses."

In the field of Rakosch, at a little distance from the city, on the eastern side of the river, the Hungarians used frequently to hold their diets; and here also the states formerly met on horseback and in arms to elect their king. At some of these assemblies, 80,000 have here pitched their tents; and the Hungarians still venerate the spot, as the remembrancer of their ancient freedom, and as an altar on which their forefathers had often sworn to defend their rights. According to Professor Hassel, Buda, in 1789, contained 21,665 inhabitants; and Pest, in 1792, 26,684; while, in the same year, M. Demian makes the population of Pest 31,000. N. Lat. 47° 29' 44", E. Long. 19° 10'. See M. Demian *Tableau Geographique et Politique des Royaumes de Hongrie*, &c. vol. i.; Hassel *Tableau Statistique de l'Em-*

pire d'Autriche; Townson's *Travels in Hungary*, p. 76; *An Itinerary from London to Constantinople*, p. 40, in Philip's *Collection of Voyages*, &c. vol. i.; and Tynna *Almanach du Commerce*, 1811. (n)

BUDDHA. See **BIRMAN EMPIRE**, p. 511, 512; and **CEYLON**.

BUDISSIN, BAUTZEN, or *Budissa*, a city of Saxony, and capital of Upper Lusatia, is situated on the river Spree. This town was founded in the year 800 by a Duke of Bohemia, from whom it received its name, and was formerly an imperial city, but it lost its privileges in the 13th century, when it was taken by the King of Bohemia. The citadel, called the castle of Ortenburg, by which the town is defended, is placed on a high rock, and is separated from the town by a ditch and ramparts. The principal public buildings are, the town-houses of the state, the electoral castle, the hotel, the two aqueducts, the cathedral, and the bridge over the Spree. Several manufactures are carried on to a considerable extent in this town. Linen cloths in great quantities are made in the town and neighbourhood, and were exported to England, Hamburg, and the Spanish colonies. There is also a great manufacture of stockings and woollen caps; and no fewer than 10,000 pairs of stockings are annually made in the town and neighbourhood. The printing of linen and cotton cloths occupies about 150 workmen, and the principal markets for these articles are in Holland, Italy, and Portugal. Glazed leather, fustians, gloves, paper, gunpowder, and iron, are also manufactured at Budissin. East Long. 14° 27', North Lat. 51° 10'. (w)

BUDWEIS, BUDIEGOVITZ, or *Budovectum*, a fortified town of Bohemia, in the circle of Bechin, situated on the river Malscha, which, after running round the town, discharges itself into the Moldau. The surrounding country is very fertile, and is enriched with several valuable mines of gold and silver. The rich silver mine of Rudolphstadt is in the vicinity of the town. This town enjoys the staple-rights of the salt which is brought from Austria, and which is here exposed to sale before it is carried farther. Pearls and precious stones are found in the river Moldau. The principal public buildings are the arsenal, and the magazines for the engineer and artillery corps. East Long. 14° 28', North Lat. 49° 2'. (w)

BUENOS AYRES.

AN extensive viceroyalty in South America, stretching from the Rio Desaguadero to the most northern settlements on the Paraguay, upwards of 1600 miles in length; and from the mouth of the Rio de la Plata to Chili, nearly 1000 in breadth. It has Amazonia on the north; Brasil and the Atlantic Ocean on the east; Patagonia on the south; and on the west, the Cordilleras, which separate it from Chili and Peru. Buenos Ayres was erected into a viceroyalty so late as 1778. It forms the most important part of the Spanish dominions in the New World, and is the channel through which the chief treasures of the other provinces pass to the mother country. It is divided into five provinces, viz. **BUENOS AYRES** or **RIO DE LA PLATA**, **PARAGUAY**, **TUCUMAN**, **LOS CHARCAS** or **POTOSI**, and **CUYO**: and its minor subdivisions, beginning from the south, are,

Pampas,	Plata,
Tuyu,	Santa Cruz de la Sierra,
Buenos Ayres,	Chayanta,
Cordova,	Oruro and Paria,
Cuyo and Mendoza,	Caranges,
Charcas,	Pacajes,
Guarana,	La Paz,
Paraguay,	Cochabamba,
Chaco,	Sicasica,
Salta,	Laricaja and Omascuyo,
Jujuy,	Chucuito,
Chicas and Tarija,	Puno, or Paucarcola,
Lipes,	Lampa,
Atacama,	Asangaro,
Potosi, or Porco,	Carabaya.

This country forms an extensive amphitheatre, shut

in laterally by the Cordilleras of Brasil and Peru; towards the north, by a tract of mountainous country, branching from both these ranges; and on the south by a branch of the Cordilleras of Chili, stretching across the continent nearly to the Atlantic, "leaving towards the south-east," says Mr Wilcocke, "the immense opening of the Rio de la Plata, as a wide and magnificent portal, proportioned to the grandeur, to the importance, and to the extent of the regions to which it gives access." These mountains are among the most remarkable in the world for height and riches. Those of the Brazilian ridge are the least elevated. They are generally covered with thick woods, interspersed with arid tracts, completely devoid of vegetation; but are rich both in mines of gold and diamonds. On the western boundary of the viceroyalty, the mountains assume an aspect of unrivalled sublimity. Their aspiring summits, which reach far above the clouds, are covered with eternal snows; and their rugged and naked sides afford no sustenance to the vegetable creation. But amidst these frozen and sterile regions, volcanoes of various dimensions diversify the scene, and mingle their fires with the snow. On the Peruvian chain, seven craters equal to Vesuvius and *Ætna*, are constantly in a state of ignition; and sixteen have been enumerated along the Chilian Cordilleras. The mountains of secondary elevation are clothed with stately forests; intersected with deep glens, through which rush innumerable torrents, and, uniting their waters, form the immense rivers which flow towards the east, and swell the Paraguay and Parana. The intervening vallies with which these mountains are interspersed, though placed at a greater elevation above the level of the sea than even the tops of the Pyrenees, yet, from their sheltered situation, enjoy a temperate and favourable climate, and are covered with a luxuriant herbage. On the tops of some of these mountains, lies the only road of communication between the different provinces; and it is said, that, from the rarefaction of the air in these regions, the traveller can scarcely breathe, and is generally affected with nausea. Within these boundaries, the country is extremely level, and, with the exception of a few hills, not exceeding 500 feet above the level of their base, it is one immense extended plain, covered with lakes and innumerable rivers, many of which, though equal to some of the largest in Europe, flow unregarded and nameless, and are considered as merely tributary streams. Few of these, however, ever reach the ocean. They are either lost in the lakes, or descend into the level plains, where they stop, without taking any decided direction, and are soon absorbed, or insensibly evaporated.

The principal rivers of this viceroyalty are, the Paraguay, the Parana, the Uruguay, and the Rio de la Plata. The first of these rises about 13 $\frac{1}{2}$ ° south latitude, in the Sierra del Paraguay, and, bending its course towards the south, passes through the lake Xarayes, and after receiving the waters of the Cuyaba, Pilcomayo, and Vermejo, terminates at its junction with the Parana. It is navigable for golettas as high as the 16th degree; and though its channel is in general narrow, M. Azara found, that opposite Assumption, where its breadth is only 1332 Paris feet, 196,618 cubic toises of water passed every hour. Its periodical flood, which is occasioned by the overflowing of the lake Xarayes, commences about the end of February, and continues gradually to increase until the end of June, when it again diminishes with the same regularity. The Parana has its source

in the mountains of Brasil, and descending by a rapid, but long and diversified course, is swelled by numerous tributary streams, among which is the Yguazu, or Curitiba; receiving the Paraguay at Corrientes, it passes on to the south; and after being joined by the Salado and other rivers from the west, loses itself in the Rio de la Plata. The Uruguay rises in the mountains which stretch along the eastern coast of America, opposite the island of St Catherine's, about the 28° of south latitude. Flowing to the west through a naked and desert region, it then takes a southerly direction, and traversing by a winding and irregular course the immense forests of Guarana, where its stream is swelled by innumerable rivulets, it passes through a rich and romantic country, receiving the waters of the Tebiquari, Mirinay, and Rio Negro, and near the 34th degree of latitude unites with the Parana to form the Rio de la Plata. Though this river is not equal either to the Paraguay or the Parana in the length of its course, yet by the immense accumulation of waters which it receives from tributary streams, it surpasses both in the breadth of its channel; and about 690 miles above its confluence with the Parana, a ten-oared boat requires half an hour to cross it. From the rockiness of its channel, and the turbulence of its stream, the Uruguay is of difficult navigation, except for *balzas*, a species of craft peculiar to South America. The name of this river is extended, by ancient authors, both to the Paraguay and the Parana; and the indiscriminate appellation is still retained by some modern geographers. The Rio de la Plata, or *River of Silver*, originally called Rio de Solis, from the name of its first discoverer, received its present appellation from Sebastian Cabot, who, having defeated a body of Indians on the banks of the Paraguay, obtained an immense booty of gold and silver. This name was applied by Cabot to the whole channel of the Paraguay, from its source to its confluence with the ocean, and the Parana and Uruguay were merely considered as tributary streams, but it is now confined to the Gulf extending from the junction of the two last mentioned rivers, to the capes St Maria on the north, and St Antonia on the south, where the water still retains its freshness, and the tide is very imperceptibly felt. Between these points it is nearly 150 miles broad. But this noble expanse of fresh water, which is without a parallel in the world, is deformed with rocks and sand banks, which render its navigation both difficult and dangerous; and is exposed to impetuous torrents of wind, called Pamperos, which sweep with dreadful fury over the vast plains of the Pampas. These storms, however, are generally preceded by thunder, which gives sufficient warning to mariners to prepare for the approaching tempest; and during these gales, Monte Video is the only part where vessels of any considerable burden can lie in safety.

The most considerable lakes are, the Titicaca, which is the most noted in South America, and lies between the two Cordilleras of Peru, in the province of Los Charcas. It is about 240 miles in circumference, of an irregular form, and navigable by vessels of considerable burthen; but subject to violent squalls of wind, which descend from the lofty mountains which surround it. It abounds with fish and water fowl; and its banks are covered with a fertile soil, and adorned with populous towns and villages. In one of its picturesque islands, Manco Capac, the founder of the Peruvian empire, is said to have first conceived the design of civilizing the naked savages of his country. This island was consider-

ed as sacred by the Peruvians, and contained one of their most splendid temples, which was enriched with the annual offerings of the worshippers of the sun. This immense accumulation of wealth was thrown into the lake upon the approach of the Spaniards, who have since made frequent attempts to recover it, but without success. The lake of Iberi, or Caracaras, lies between the rivers Parana and Uruguay. Its northern boundary runs in a parallel line with the banks of the former river for nearly 30 leagues, and extends as far to the south; it supplies the river Mirinay, which runs into the Uruguay; and from its south-western corner issue three other considerable streams, viz. the Sta Lucia, Corrientes, and Bateles, none of which are fordable. This lake receives neither rivers, brook, nor spring, but is nourished entirely by the simple filtration of the waters of the Parana, a phenomenon of which there is no other example in the world; and this filtration thus supplies not only the four great rivers which issue from the lake, but also the vast quantity of water which must be continually carried off by evaporation, from a surface of more than a thousand square leagues, which, from the experiments of Halley, may be estimated at above 70,000 tons a-day, supposing it the mean temperature of England. This expanse of water, however, is for the most part very shallow, and filled with aquatic plants; so that its interior is altogether inaccessible. The islands with which it is studded, are well stocked with deer and other game; flocks of wild fowl are continually skimming on its surface; its fish are remarkably sweet and fresh; and many flourishing presidencies are established on its shores.

Among the lakes of this country, there are many which are full of water during the rainy season, and are perfectly dry throughout the rest of the year, and filled with sword-grass, and other aquatic plants. Of this description is the famous lake Xarayes, in the province of Los Chiquitos, which is formed by the overflowing of the Paraguay. The channel of this river being unable to contain the rapid accumulation of water produced by the rains which fall during the months of November, December, January, and February, it is spread over a flat and level country, to an immense extent, but so shallow, that though the Xarayes at its height is nearly 110 leagues in length, and 40 in breadth, yet in no part is it navigable. This lake was formerly supposed to be the source of the Paraguay; and many stories were told concerning a beautiful island near its centre, which, from the salubrity of its air, and the spontaneous fertility of its soil, was called the island of Paradise, and which was said to be inhabited by the Orejones, a Peruvian nation, who had taken refuge here on the conquest of their country. These, however, and other fables, with which the history of the Orejones are embellished, are merely the ebullitions of Spanish romance, without either foundation or probability. Of the same nature with the Xarayes are the lakes Aguarcaty, and Neembucu, and all those east of the river Paraguay, with an innumerable multitude of others, on the banks of the different rivers, which traverse this extensive vice royalty.

A chain of salt lakes extends from west to east, between the Andes of Chili and the Rio de la Plata. One of these, in particular, which lies about 120 leagues S. W. of Buenos Ayres, is remarkably salt. It is nearly 18 miles in circumference, and the salt found at the bottom is so hard and thick, that it is difficult to break it with iron tools. Two or three hundred carts are annu-

ally loaded with it, and carried to Buenos Ayres; and what is very remarkable in this chain is, that a few of the lakes are fresh, though during the rains they are so swelled, that they often communicate with those that are salt. Besides these lakes, all the springs throughout the greater part of the flat country, west of the Parana and Paraguay, are more or less salt; and few of their waters can be drank till they enter the Parana. The soil of this region, extending about 700 miles in length, and 190 in breadth, is saturated with fossil salt. Great quantities of it are refined for consumption; but it is most abundant between Sta Fé and Cordova, and, in the vicinity of San Jago del Estero, the whole ground is covered with a white incrustation of this substance.

Every variety of soil, and every diversity of climate, is to be found in this extensive region; from the barren and inhospitable steeps of the Andes, whose summits are covered with never melting snows, and the burning deserts of Chaco, to the fertile and delightful vallies which skirt the borders of the Uruguay and Parana. Here all the productions of the temperate and torrid zones find soils and situations adapted to their various natures. We may observe, however, that this variety of climate follows no exact gradation arising from the difference of latitude; but the heat and cold of this country seems to depend rather on the direction of the winds, than the position or declination of the sun. A south, or south-east wind, is always attended with cold, while it is as invariably warm with a wind from the north. At Assumption, which lies in nearly the centre latitude of the viceroyalty, M. Azara found, that in ordinary days, during the summer, the mercury in Fahrenheit's thermometer rose, in his chamber, to 85°, and, on some extraordinary occasions, mounted as high as 100°; while in winter it fell as low as 45°; and, in 1786 and 1789, water froze in the court before his house. The common winds in this country are the east and north. If the south-west blows, the sky becomes calm and serene; and a west wind is here scarcely known; or if it be sometimes felt, it never lasts above a couple of hours. A south-east wind generally precedes the rains in winter; but it is most severe during the spring and summer, sometimes raising such clouds of dust, as completely to conceal the sun. Hurricanes are very rare, but when they do happen are rather violent; as that on the 14th of May 1799, which overturned one half of the town of Atira in Paraguay, and killed 36 persons. Fogs, snow, and hail, are seldom seen, except on the summits of the mountains. Thunder storms, however, are both frequent and violent; and, notwithstanding the level nature of the country, and the absence of woods and rising grounds, the bolt falls ten times more frequently here than in the south of Europe. In one of these storms, which happened on the 21st of Jan. 1793, the thunder-bolt fell 37 times in the interior of the city of Buenos Ayres, and killed 19 persons. According to M. Azara, the storms of rain and thunder, which are so prevalent in this country, cannot be attributed to the influence of mountains and woods, as there is not a mountain within a hundred leagues of Buenos Ayres, nor a tree south of the river La Plata, or even on the north as far as Paraguay, except on the banks of the rivulets. They must therefore be owing to some peculiarity in the nature of the atmosphere. It must contain a greater quantity of electric fluid than the atmosphere of Europe, and also possess some quality more suited to the condensation of vapour and reducing it to rain. The same author has

observed, that the humidity of the atmosphere, and the violence of the winds, gradually increases from the city of Assumption to Buenos Ayres; and that the thunder-storms, on the contrary, are less violent as they proceed to the south. The salubrity of the climate, however, is surpassed by that of no other country in the world. Even in the vicinity of the marshes and inundated lands, which are here to be frequently met with, the health of the inhabitants is not in the smallest degree affected.

We have already mentioned, that this viceroyalty is divided into five provinces; of each of which we shall now proceed to give a very brief and general description, beginning with Buenos Ayres. This province, whose name implies the salubrity of its climate, enjoys nearly the same temperature throughout the year. The rains, however, are sometimes of long continuance, and thunder storms are not uncommon. The pamperos, too, which we have already mentioned, are very disagreeable, and even at times dangerous, from their fury. The soil in the vicinity of the town, and also on the north side of the river, is, in general, rich and productive, requiring very little labour, and no manure, to yield abundance of wheat and maize; also, most kinds of European fruits, as grapes, melons, figs, apples, pears, peaches, and cherries; and even the productions of warmer climates, as pimento, oranges, ananas, &c. Between Buenos Ayres and the river Saladillo is one complete plain, without a tree or rising ground, till near the banks of the river, which is about 60 miles from the Spanish settlements. On the south of the river, and extending far to the north-west, are the immense plains of Pampas, which present a sea of waving grass for 900 miles, with very few interruptions of wood and eminences. Their luxuriant and nutritive herbage affords pasture to innumerable herds of cattle, that rove unowned and unvalued, and whose hides and tallow alone are sought after by the Spaniards, and form a principal article of the trade of Buenos Ayres. They are also the abode of immense troops of wild horses and deer, ostriches, armadillos, partridges, wild geese, ducks, and other game; and towards the frontiers of Chili, guanacoes and vicuñas are met with in considerable numbers. Over these plains lies the only route between Buenos Ayres and Chili. The Spaniards generally perform this journey in companies, as the plains are infested by tribes of savage Indians, who go there for the purpose of hunting wild horses, and to rob such travellers as they can surprise and overpower. Through this extensive flat, there are no landmarks or traces by which the road can be discovered for many hundred miles, so that they are obliged to pursue their route by the compass. They generally travel in covered caravans, drawn by oxen, and are accompanied with baggage-horses and mules. These caravans are made almost as commodious as a house. They have doors to shut, and windows on each side; and the floor is covered with a mattress, on which the passengers sleep for the greatest part of the journey. Travellers, however, are sometimes reduced to great distress, both from the intense heats, which prevail during the middle of the day, and the scarcity of water, which is often not to be met with for several days journey. The road leading from Buenos Ayres to Peru is very different. Post-houses are erected at regular stages, where relays of horses and carriages are provided for travellers; and as no wild and unsubdued Indians lie on that track, they are under no apprehension of any sudden surprise.

The province of Paraguay, though rich in none of the precious metals, is one of the most opulent in the new viceroyalty, from its vegetable productions. The climate is, in general, temperate and agreeable; the trees are clothed in perennial verdure; and the extensive plains, which are covered with the richest pasture, are enlivened with prodigious herds of horses, mules, cattle, and sheep. The herb of Paraguay, a species of tea, grows here in great abundance, and forms a considerable article of traffic with the other provinces. They carry on also a considerable trade in wax and honey. Numerous missions, established by the Jesuits, are scattered over the province, which are now converted into presidencies, and governed in the same manner as the other Spanish settlements. These presidencies have greatly declined since the fall of the Jesuits; and it was with difficulty that the Franciscan and Dominican fathers, who succeeded the Jesuits, could prevent their total abandonment by the converted Indians. Their united population is now estimated at from 30,000 to 40,000 families.

Tucuman is a rich inland province, producing all kinds of grain and fruits, and abundant pasturage, but of a warm and rather humid temperature. It is watered with many beautiful rivers; and there are carriage roads through the greatest part of the province. The woods afford wax and honey, and plenty of game; but are infested with the American tyger, and other beasts of prey. Cotton is cultivated in the neighbourhood of San Jago del Estero, and a small quantity of cochineal is occasionally collected; but indigo, which was formerly here a great commodity, is now, through the neglect of the inhabitants, entirely lost. The Tucuman mules are famous over all the viceroyalty for strength and docility; and, according to Estalla, there is no person in this province so poor, that does not kill a cow or a heifer every day for the support of his family.

The province of Los Charcas contains some immense deserts and impenetrable forests; but also some extensive and fertile plains, intercepted by the stupendous heights of the Cordilleras. The air is in general mild, and varies very little throughout the year, except on the mountains. In the district of Potosi, it is extremely cold and dry, and the country remarkably barren, producing neither grain, fruits, nor vegetables; while at Tomina, about 120 miles east from the city of Potosi, the air is hot and sultry, and the soil is covered with vineyards and sugar plantations. The delightful vales of Tarija are watered by abundant streams, and are celebrated as surpassing every other part of America, in the salubrity of their climate and the fertility of their soil. Wheat, maize, cocoa, grapes, flax, Paraguay tea, &c. are produced almost spontaneously; and its annual exportation of cattle is computed at 10,000 head, each valued at from eight to ten dollars. The higher regions of this province abound in vicuñas, pacos, guanacoes, and lamas, which indeed are common to all those tracts, where the elevation renders the air continually cold. Los Charcas is of immense extent towards the north, reaching from the borders of Peru to the confines of Brazil, and comprehending the extensive countries of Chaco, and of the Chiquitos, Moxos, and Chiriguano Indians.

Cuyo borders on the Andes of Chili, and with that country presents the same phenomenon which is observable in the peninsula of India, where the Ghauts, and the Table-land of Mysore, separate the coasts of Coro-

mandel and Malabar. The seasons in these countries are opposite in their effects to each other; and when tempestuous on one side of the Cordilleras, it is serene on the other. In Cuyo the winter is excessively cold, insomuch that the cattle die in the fields if not housed; while, in summer, the heats are intense, and thunder storms are frequent and violent. The soil, however, is fertile in grain, and most kinds of European fruits. Wine is produced in great abundance, and of excellent quality. It is drunk over all Spanish America; and Mendoza, and San Juan de la Frontera, sometimes export, in one year, 20,000 barrels. Brandy also forms a considerable article of traffic; and vicunna wool is sent in great quantities from this province to Europe.

The following are the principal cities which are scattered over this viceroyalty, with their latitudes, and the year of their foundation :

	S. Lat.	Year.
Buenos Ayres, - - -	34° 36' 28"	1535.
Monte Video, - - -	34 54 36	1724.
Maldonado, - - -	34 53 12	1730.
Colonia or San-Sacramento, -	34 26 10	1679.
Sta. Fé, - - -	31 40 29	1573.
Corrientes, - - -	27 27 21	1588.
Assumption, - - -	25 16 40	1536.

Santa Cruz, - - -	17 49 44	1575.
Mendoza, - - -	34 20 0	
San Juan de la Frontera, -	32 0 0	

Notwithstanding the fertility of this country, the benignity of the climate, and the many natural advantages which it enjoys for the purposes of agriculture, the cultivation of the soil has been in a great measure neglected; and this viceroyalty, which, by proper regulations and active industry, might have been rendered the granary of the old world, has hitherto produced little more than what is necessary for the consumption of its inhabitants. The native pride and indolence of the Spaniards, and the brutish sluggishness of the Indians, form the great bar to agricultural improvements in the New World; and extensive plains, fertilized by innumerable rivers, are employed merely in the breeding of cattle. Of late, however, some attempts have been made for the promoting of colonial cultivation, by the introduction of negro labourers and improved implements of agriculture. But many years must pass, and Africa must be drained of many myriads of her sons, before these advantages can be estimated or felt; and we cannot wish success to a system, which can only be upheld by cruelty and oppression. The mineral treasures which this continent contains in its bowels, were the first inducements which led its conquerors to forsake their homes, and brave the dangers and deprivations of foreign warfare. For these, the produce of its surface was neglected and despised; and these still continue to

be the magnets which attract the cupidity and ambition of European adventurers.

The mines of this viceroyalty are chiefly confined to the north-western districts, which, in 1778, were separated from Peru; and consist of gold, silver, mercury, copper, lead, and platina. These mines are all in the hands of private individuals, who, upon the discovery of a mine, immediately receive from the king a grant of a piece of ground, containing 80 Spanish yards in length, and 40 in breadth, in the direction of the vein or bed; and are only held to pay a certain duty to government upon the minerals extracted. This duty is valued by Bourgoing, on an average for all the Spanish colonies in America, at $11\frac{1}{2}$ per cent. of the silver, and 3 per cent. of the gold. The proprietors seldom work the metals themselves, as they find more account in letting them out to others, who often enter upon very hazardous, and sometimes ruinous speculations. Though new and rich veins of treasure are almost daily discovered, yet few of them are very profitable to their possessors, being soon abandoned, either from the destruction of the works, by the rushing in of the water, from the vein failing, or from the miner not being able to support the expense.

The following table, which is given by Helms, contains a specification of the various mines that are at present in a state of exploration in the different districts, as registered in the chancery :

Districts.	Gold.	Silver.	Cop-per.	Tm.	Lead.
Tucuman, - - -	2	1	2	-	2
Mendoza, - - -	-	1	-	-	-
Atacama, - - -	2	2	1	-	1
Caranges, - - -	-	2	1	-	-
Lipes, - - -	2	1	1	-	1
Porco, - - -	1	2	1	-	-
Potosi, - - -	-	1	-	-	-
Pacages or Berenguela, -	-	1	-	-	-
Chucuito, - - -	-	2	-	-	-
Puno, - - -	-	1	-	-	-
Lampa, - - -	-	2	-	-	-
Chicas and Tarija, - -	4	5	-	-	1
Cochabamba, - - -	1	-	-	-	-
Sicasica, - - -	2	-	-	-	-
Laricaja, - - -	4	-	-	-	-
Omascuyo, - - -	4	-	-	-	-

Paria, - - -	-	1	-	1	1
Monte Video, - - -	1	-	-	-	-
Total,	30	27	7	2	7

Among these, the silver mine of Potosi is by far the most productive, and indeed the only one particularly deserving of attention. The mountain, from which the metal is extracted, is of a conical form, about six leagues in circumference, and 4182 feet above the neighbouring plains. The discovery of its treasure was owing entirely to accident: a Peruvian, named Diego Hualpa, while chasing some chamoyos among the rocks, in his ascent laid hold of a small shrub, whose roots giving

way, disclosed to his view an immense vein of silver, which has been since distinguished by the name of *La Rica*, or the Rich. The Indian concealed the circumstance from all his friends, and only had recourse to this treasure to supply his occasional wants; but the obvious change in his fortune had excited the suspicions of one of his companions, who, by urgent entreaties, drew from him the secret, but who, upon some slight quarrel, soon after revealed it to his master, a Spaniard. The information was no sooner received than the mine was opened; and it was formally registered on the 21st of April 1545. Since that time, it has been constantly wrought, and the silver, which has paid the royal duties from this mine, has been valued at 5750 millions of livres tournois, equal to 234,693,840*l.* sterling. The mountain is now almost completely excavated, and is perforated with above 300 pits, few of which, however, are more than 70 yards deep. It is now opened at the base, and vaults dug horizontally, penetrate into its bowels, and meet the veins of silver. In these vaults, which are called by the miners *sacabouas*, and are about six feet high and eight feet broad, the air is cold and unwholesome, and there the Indians work alternately night and day, deprived of the light and heat of the sun, and entirely naked, to prevent them from embezzling any of the ore.

On the first discovery of the mine of Potosi, the metal was much purer than it is at present, being now greatly reduced, and even inferior to many of the other mines. It is the abundance of the ore alone, which renders it worth working. According to Acosta, the average contents of silver in the crude ore were, in 1574, from 8 to 9 marks per quintal; and the minerals, which yielded 50 marks per quintal, were considered as extremely rich. Since the beginning of the 18th century, however, they reckon only from 3 to 4 marks per caxon,* or from $\frac{48}{100}$ to $\frac{100}{100}$ per quintal. From this it appears, that the mean riches of the minerals have diminished in the proportion of 170 to 1; but what is surprising, the quantity of silver extracted from the mines of Potosi has only diminished in the proportion of 4 to 1, as will be seen in the following calculations, which are given by Humboldt in a more extended form.

1. From the opening of the mines of Potosi in 1545 to the year 1556, when the royal duties were first recorded with accuracy, Ulloa, upon the authority of Don Sebastian Sandoval y Guzman, who published an account of these mines in 1634, entitled *Pretensiones del Potosi*, makes the total produce which paid duty to be 613 millions of piastres, making an yearly average of 55,726,000 piastres, or 6,556,000 marks of silver. This immense sum however, M. Humboldt, upon no less unquestionable data, has reduced to 127,500,000 piastres, or 15,000,000 of marks, making an annual produce of nearly 1,363,636 $\frac{1}{2}$ marks.

2. The royal duties† paid on the silver extracted from the mines of Potosi, between the 1st of January 1556, and the 31st of December 1578, during which the fifth only was paid, amounted to 9,801,906 piastres, making a total produce of 49,009,530 piastres; or 5,765,827 marks of silver, which, for 23 years, makes the average annual produce of 250,688 marks.

* A caxon contains about fifty hundred weight.

† These duties are extracted from a book of accounts in the royal treasury of Potosi. This book, however, contains no information relative to the years anterior to 1556, although two miners of Porco, Juan de Villaroel and Diego Centeno began to work this vein in 1545.

‡ The covos is an ancient duty, given by the Emperor Charles V. to Don Francisco de los Covos, but which was afterwards assumed by the crown.

§ According to Azara, more than a third of the silver drawn from the mines of Potosi was never registered.

3. The duties paid from the 1st of January 1579 to the 19th of July 1736, during which one and a half per cent. *de covos*‡ was first paid, and then the fifth of the remaining 98 $\frac{1}{2}$ piastres, amounted to 129,417,273 piastres, making a total produce of nearly 610,458,835 piastres, or 71,818,686 $\frac{1}{2}$ marks of silver, which, for 157 $\frac{1}{2}$ years, is at an annual average produce of nearly 455,991 $\frac{1}{2}$ marks.

4. Between the 20th of July 1736, and the 31st of December 1789, during which the one and a half per cent. *de covos* and the half of the fifth only were paid, the royal duties amounted to 14,542,684 piastres, making a total produce of 128,129,574 $\frac{1}{2}$ piastres, or, 15,074,044 marks of silver, which, for 53 $\frac{1}{2}$ years, makes an annual produce of nearly 281,758 marks.

5. From 1789 to 1803, we have no account of the royal duties; but during that period the total produce of Potosi, according to the records of the mint, were 46,000,000 of piastres, or 5,411,764 marks, making an yearly average of 386,554 $\frac{1}{2}$ marks.

From these calculations, it appears that the annual produce of the last period is little more than a fourth of that of the first; but in giving the average produce for periods of such a length, the gradual diminution or increase of the quantity of silver extracted from these mines could not be distinctly marked. We may therefore observe, that during the second period, when the royal duties were first correctly registered, the king's fifth varied from 500,000 to 300,000 piastres; and that during the first 50 years of the third period, the duties varied from 1,000,000 to 1,500,000 piastres; and then gradually diminished until 1735, when they only amounted to 271,621 piastres, 6 reals. From 1737 to 1789, the increase was equally gradual from 183,704 to 335,468 piastres. We may also remark, that in these calculations, we have uniformly valued the piastre at only 8 reals *de plata*, while we are assured, that until near the close of the 16th century, the Spaniards reckoned by piastres of 480 maravedis, or nearly 13 $\frac{1}{2}$ reals *de plata*. In estimating, therefore, the total produce of these mines from 1545 to 1803, allowance must be made for this low valuation.

The quantity of silver extracted from the mines of Potosi during the

	Marks.
1st period, was	15,000,000
2d	5,765,827
3d	71,818,686
4th	15,074,044
5th	5,411,764

	113,070,321
Allowance for the value of the piastre before 1600	15,000,000
	<hr/>
	128,070,321

To this may be added one fourth of the total produce, on account of the enormous contraband at the beginning of working the mines§ 32,017,580

Total produce 160,087,901

From this statement of the wealth drawn from one mine, the reader is not to conclude, that the other mines of Buenos Ayres are in any degree equally productive. Of the immense quantity of silver produced by this viceroyalty, the single mine of Potosi furnishes more than three fourths. None of the rest are so constantly wrought, being either interrupted by inundations or destroyed by neglect. In the district of Caranges, detached pieces of silver, unmixed with any ore or stone, are found in the sandy deserts extending towards the coast of the South Sea. These pieces are called *pafas* or yams, being taken out of the sand in the same manner as that root is taken out of the ground, and are of various forms and sizes. Two marks or 16 ounces is the general weight; but Ulloa mentions two *pafas* which he saw at Lima, one weighing 60 and the other 150 marks.

The principal gold-mines in this viceroyalty are those of Cochabamba, and Sicasica. The latter belong to Indian natives, and are reckoned very productive, but from the elevation of the mountain are not properly wrought. Pieces of gold of near an ounce weight are sometimes discovered in the sand, washed down by the rains. In 1730 an Indian found a lump of this metal, which the Marquis de Castel Fuerte bought for 12,000 pieces of eight, and sent it to Spain as a present to his sovereign. Considerable quantities of gold in dust and in grains are found in the sand of the Vermejo in the district of Chayanta; and particles of gold abound in the streams which run in the vicinity of the Indian town of *Moxos*, but much of it is lost, as those only are collected which are of the size of a large pin's head. A gold mine is now wrought in the district of Monte Video. Concerning the quantity of this metal, however, which has been furnished by the viceroyalty of Buenos Ayres, from the first discovery of its mines, we have no information. In 1790 there was coined at the mint of Potosi, 4,222,000 piastres, viz. 299,246 piastres, or 2204 marks in gold, and 3,293,173 piastres, or 462,609 marks in silver. At the beginning of the 19th century, the annual produce of the mines of this viceroyalty, which paid the regular duties, was 2200 marks of gold, and 414,000 marks of silver; in all 4,212,404 piastres.* And estimating, with Humboldt, the fraudulent exportation of silver at a sixth, or 67,000 marks, we have a total annual produce of 4,850,000 piastres.†

In the mountains of Berenguela are mines of talc, called *jaspas blancos de Berenguela*, which is beautifully transparent, and is used for windows throughout a great part of Peru. There are also several mines that yield

gems, particularly one of emeralds, much prized for their quality by the lapidaries of Europe; but which, owing to some latent reasons, has not been lately resorted to. It is probable that it was from this mine that the Incas derived those extraordinary emeralds, which excited the wonder and avarice of the Spaniards, who ignorantly destroyed great numbers of them from the erroneous idea, that if they were real gems, they would stand the stroke of a hammer on an anvil. Many of them have been found in the ancient tombs of the Peruvians, polished and wrought in spherical, cylindrical, and other figures, with mathematical accuracy, and with all the delicacy of European workmanship.

Among the mineral productions of this country, we may mention a singular mass of iron, in the province of Tucuman, which is described both by Estalla and Azara. It lies about 70 leagues from San Jago del Estero, nearly in lat. 28°, and about 30 leagues from Corrientes. It has a horizontal position; its surface, which is full of rifts and irregularities, is open and exposed, and level with the ground; and its dimensions are 13 palmos in length, 8 in breadth, and 6 in thickness; and its solid contents 624 cubic palmos.‡ The quality of this mass is equally pure and ductile with that of any other iron, and pieces hewn out with a chissel shew a brilliant colour, like fine silver, speckled with red and yellow spots. It is malleable in the forge, and excoriates during the operation, and may be wrought with a file, or drawn into wire like common iron; but it is, at the same time, so hard, that when cutting it, the chissels are often notched and broken. This block of iron has engaged much of the attention of the mineralogists of Europe; and many opinions have been formed concerning its nature and origin. Don Miguel Rubin-de-Celis, who examined it by order of the King of Spain in 1783, and who published an account of it in the Philosophical Transactions, supposes it to be of volcanic origin. But M. Azara rejects this supposition as altogether improbable, both from the nature and the situation of the iron; instead of being brittle, it is both flexible and ductile; there is not the least appearance of volcanic matter in the neighbourhood; the nearest volcanoes of the Cordilleras is at 300 leagues distance; and had it been thrown from any of these, it must have sunk deep into the earth, beyond the inspection of man. "I am, however, unable," says Azara, "to explain the origin of this iron; but I am inclined to believe that it is as ancient as the world, and that it came out of the hands of the Creator in the same state in which it now exists."§

After this brief description of the mineral contents of

* The gold is here valued at 145 $\frac{2}{3}$ piastres, and the silver at 9 $\frac{4}{10}$ piastres per mark of Castile.

† These statements are extracted from Mr Black's translation of "*Humboldt's Essai Politique sur le Royaume de la Nouvelle Espagne*." Some of them appear to be rather incorrect; but, as we have not the means at present of rectifying any casual error, we have given them exactly as we found them.

‡ The *pulmo* is equal to nine inches of Castile.

§ M. Proust, who examined some fragments of this substance, found that *nickel* was mixed with the iron; but he was unable to conclude whether this alloy was the work of nature or of art. That this mass of iron is a production of nature can now scarcely be disputed; and though such a phenomenon be very rare, yet there are two other examples, which it would be equally difficult to account for upon any other supposition, viz. the immense mass of malleable iron which Professor Pallas found on the top of a mountain in Siberia, near the river Yenisei, and which weighed 1680 Russian pounds; and the huge block of the same substance discovered at Aken, near Magdeburg, under the pavement of the city, which weighed from 15 to 17,000 weight, and which possessed all the qualities of the best English steel. Dr Chaldni, of Wertemberg, published a work upon this subject, in 1794, in which he examines all the hypotheses which have been invented, in order to explain the formation of these three masses of native iron; and concludes with classing them among those bodies, which have lately exercised the ingenuity of the learned, under the name of *meteoric stones*, &c. See METEORIC STONES.*

(*) When we consider the facility with which metallic iron is oxidized, above, as well as under, the surface of the earth, we cannot refrain from expressing our doubts of the existence of pure metallic iron in the *native state*. Mr Guyton Morveau even doubts the possibility of it, because iron is never really ductile till it has passed under the hammer; and because there is not any solution, either humid

Buenos Ayres, we may now proceed to give some account of the animal and vegetable productions which are peculiar to this region of the world. Among the former we may mention the *tapir*, or *mborebi*, which is one of the largest class of animals in South America. It is about 6 feet long, and $3\frac{1}{2}$ high, with a short tail of $3\frac{1}{2}$ inches in length.* The legs are short, and the body round and heavy; yet it runs very swiftly, and swims with great rapidity. It has a long neck, surmounted by a coarse mane, which descends over the forehead as far as the eyes; and at the extremity of the muzzle is a projection of about $2\frac{1}{2}$ inches long, which it can dilate and contract at pleasure, and which serves the same purposes as the trunk of the elephant. Its skin is of a firm texture, and of a dark leaden colour, except the under part of the head, the throat, and the tips of the ears, which are whitish. This animal delights in the water, and lives chiefly in the marshes, and along the banks of rivers and lakes. It is of a dull and timid nature, never stirring out but at night. It is, however, very easily tamed, and its flesh is eaten by the Indians. But though it lives entirely upon vegetables when in a state of liberty, yet, when domesticated, it devours every thing that comes in its way. Tapirs frequent the banks of the Paraguay and Parana, and generally wander in large companies.

The *tamandua*, or *nurumi*, or ant-eater, is a very singular animal, both with respect to its form and dispositions. Its body, which is very thick, is $53\frac{1}{2}$ inches in length, and its tail $28\frac{1}{2}$, independent of a bunch of hair at its extremity. The head is long and woolly, somewhat resembling the form of a trumpet, and scarcely thicker than its tail; the ears short and round; the eyes small; the mouth narrow, and without any kind of teeth, but furnished with a long tongue, not exactly round, fleshy, and flexible, and which it sometimes stretches out a foot in length. Its feet are ill formed, and are merely stumps, armed with claws; of which, however, it makes very little use, unless for defence. It is a most stupid and sluggish animal; never flies from an enemy, but waits for his approach, seated on its haunches, and, grasping him in its arms, destroys him with its claws, which are its only weapons. This animal feeds upon ants, which it gathers with its long tongue; but the smaller species, which climb the trees, and support themselves by the tail, eat honey and bees. This smaller species, which is the *tamandua* of Buffon, is called *caguare* by Azara. It differs from the *nurumi* both in size and colour. It is also covered with wool instead of hair; and about a third of its tail, towards the extremity, is perfectly bare.

The *sarigue*, or the *secundo*, according to Azara, is an animal peculiar to America. There are several species

of them, but the common characters of all are, a triangular face, very sharp and long; eyes oblique, and jutting out; a wide mouth, and better furnished with teeth than that of any other animal; long whiskers; round ears, which are naked and transparent; a short neck; and long tail, which is thick and vigorous, and almost entirely covered with scales, and which it uses in climbing trees, performing this operation with great facility, and even walls, if the surface be at all rough. The dugs of the female are placed in the form of an ellipse, with one in the centre; and, as soon as she has brought forth her young, she applies each of them to a dug, which it never leaves until it is able to walk and eat alone. The largest of these animals is about $1\frac{1}{2}$ foot long in the body, and 13 inches in the tail. They inhabit the plains in preference to the woods, and hide themselves in bushes or tufts of long grass, or in holes which they dig in the ground. They live upon insects, eggs, small lizards, and mice. They also eat fruit, and are very destructive to poultry; but, when they kill a fowl, they in general merely lick the blood.

The *tatoo*, or *armadillo*, is very common over all the continent of South America, which is their native and exclusive clime. The body and legs of this animal are very thick, the neck very short, and the claws strong, crooked, and of a great length. Its head is pointed at the snout, the eyes small, and the tongue very long and flexible. A testaceous crust, resembling a coat of mail, extends over the head, back, and tail; and its belly and breast are covered with scaly tubercles, from which spring long bristles. The scales of the forehead, as well as those upon the shoulders and the buttocks, are not susceptible of flexibility, or motion; but those of the body and the tail are disposed in transversal bands, joined to each other by membranes, which allow the animal to stretch or contract itself at pleasure. The *tatoos* live in burrows under ground, which they dig with great facility, the mole not being more expert; and, indeed, this is their only means of defence, for their motion is so slow, that, when pursued by a man, they must inevitably be taken, unless they escape into the earth. This animal feeds upon worms, insects, ants, and carrion, but never drinks. Its flesh is fat and delicate, and equal to that of a sucking pig. M. Azara has enumerated eight species of the armadillo, of which the largest is the great or *giant tatoo*, whose body measures $38\frac{1}{2}$ inches in length, and its tail $18\frac{1}{2}$; and the smallest, or *tatee-pichy*, is only 10 inches long without the tail, which is $4\frac{1}{2}$.

The *cuiy* is a remarkable animal, about a foot long, with a thick, nervous tail, nine inches in length, and entirely bare towards the extremity. The muzzle is adorned with whiskers; the mouth and teeth like those of a mouse; the eye very small; and the ear short and

or dry, which can supply the place of that operation. Hence, Chaptal is inclined to believe, that the masses of native iron, of which we have heard, owe their origin either to the labour of man, or to subterranean fires. Perhaps future analysis may prove them to be compounds, possessing many properties of metallic iron, without being really such. The "brilliant colour, like fine silver, speckled with red and yellow spots," (in the mass above described) is certainly not common to metallic iron; but prove, in our opinion, that it is a compound.

We transcribe from the Mineralogical Journal, conducted by Archibald Bruce, M. D. Vol. 1. No. 2, the following account of a mass of malleable iron, now exhibiting in New-York. There is at present in this city a mass of iron, which was sent hither a short time since from New-Orleans, by Mr G. Johnson, and which, from its size and weight, has excited considerable attention (Its form, which is irregular, may be compared to the profile of an egg.) Its greatest length is three feet four inches; its greatest breadth is two feet four and an half inches. It weighs upwards of 3000 lbs. Its surface, which is covered by a blackish crust, is greatly indented, from which it would appear that this mass had been in a soft state. On removing the crust, the iron, on exposure to moisture, soon becomes oxidated. Specific gravity, 7,400.

It appears to consist entirely of iron, which possesses a high degree of malleability; experiments having been made without detecting nickel or any other metal. This enormous mass of iron is said to have been found near the Red river. (Which empties itself into the Mississippi.) HEMMEL, Jr.

* These dimensions are given in French feet, which are to the English as 3250 to 3047.

VOL. IV. PART II.

5 G

without hair, and entirely concealed under bristles. These bristles, which are very sharp and strong, defend the head, body, and part of the tail; and those on the tape of the neck are about two inches long. There are none, however, on the feet or belly, which are covered with brown hair. The female brings forth only one at a time. She has two paps on the pectoral muscles, and one about an inch farther down. The cuiy climbs the largest trees with the greatest facility; and can stand firm upon the point of a vertical pole without supporting itself by the tail, which it only uses when descending. It is, however, a most phlegmatic and indolent animal. M. Azara, who kept one in his chamber for nearly a year, observed that it never shewed the least sign of joy, sorrow, or gratitude, but, on the contrary, the greatest stupidity, sluggishness, and indifference. It would remain a whole day, sometimes two, without changing its posture, or even moving; and always rested on its hind paws, with its fore-feet in the air, and its body bent forward. Nothing disturbed it, and it cared not who entered, or who went out. Once a day it ate fruits and vegetables, which it held in its paws, but very little at a time, and never drank. This animal is found chiefly in the forests of Paraguay.

These are the most remarkable among the quadrupeds of this region. They bear no analogy to those of the old world; and, from their nature and habits, seem to be intended to live for ever in the wilds and the desert. Without almost any means of defence, or any resources against the attacks of man, their numbers must be diminished as the inhabitants of the country increase; and it is probable, that a considerable increase of population will be followed with the total extermination of their species.

Besides these, are several varieties of animals common to the ancient continent, but which have been supposed to have degenerated in an American climate. Such a supposition, however, is altogether erroneous; for some of them yield, neither in size, in fierceness, nor in strength, to those of any other quarter of the world. The tyger is larger, and is equal in ferocity to any of Africa. Dobrizhoffer mentions the skin of one which measured three ells and two inches in length. They kill and carry off oxen and horses; and one or two of them, says Bouguer, are sufficient to desolate a province. The stags and oxen are also equal to those of Europe; but the *puma*, or American lion, is much weaker and smaller than those of Africa, and are so cowardly, that they will fly from the barking of a dog.

Of the domestic animals, the most useful are the *lama* and *paco*, both natives of this country, and inhabiting the Cordilleras, and the higher districts of Tucuman and Los Charcas. There are five species of these animals, distinguished by the names of *lamo*, *guanaco*, *moromoro* or *chilihueque*, *vicunna*, and *paco*; but they are often confounded by naturalists, and all the accounts which have as yet been received, concerning their different properties and appearances, are involved in considerable obscurity. Some suppose, that the *guanaco* and *vicunna* are merely the *lama* and *paco* in a state of nature; and that the *moromoro* or *chilihueque*, is the domestic *lama* of Chili. This idea, however, is sufficiently confuted by Molina, (in his *Natural History of Chili*, to which we must refer our readers for a particular description of these animals). He distinguishes the *guanaco* as having hair, and a hunch on the back, while the *lama* is flat, and covered with wool. The *paco* approaches so near to the *lama*,

that it is even difficult to pronounce them a separate species; but the *vicunna* is very different from both, and is an elegantly formed animal, about the size and shape of a tame goat, except that the neck is longer; the head is round, and destitute of horns, and the muzzle short and beardless. Its wool is extremely fine, of a beautiful fawn colour, and constitutes a most valuable article of commerce. All these animals, in their wild state, inhabit and pasture on the highest parts of the mountains. They seem to delight in the regions of ice and snow, always preferring the north side of the hills, and appear more vigorous in proportion to the coldness of their situation. Those that are domesticated are very serviceable to the inhabitants, both for food, clothing, and as beasts of burden. The *lama* will carry from 150 to 200 pounds weight, with the greatest safety, over precipices and rugged mountains, where man can scarcely follow it; and a small portion of reedy grass, called *ichu*, is its only nourishment. Some of them, however, are of such a stubborn nature, that, when they once lie down with their load, they will suffer themselves to be cut to pieces rather than rise before they are sufficiently rested. They all produce bezoar-stones, but the wild animals yield the best, being both larger, and of a better quality and colour, than those produced in a state of slavery, which are small, black, and of little value.

Among the immense variety of birds which inhabit this country, and of which M. Azara has enumerated 448 different species, the *Nandu* and *Condor* are the chief. The *nandu*, or American ostrich, approximates nearly to the ostrich of Africa, except in the form of its feet, upon which it has three toes, while the other has only one. It is called *emu* by the Portuguese, and is to be found chiefly in the plains of Monte Video, and the Pampas of Buenos Ayres. It is nearly six feet high, and runs with such rapidity, that the fleetest dogs are outstripped in the pursuit. What is most singular in this bird is, that several of the females deposit their eggs in the same nest; and that a single male takes the charge of hatching them, and of leading out, and protecting the young. The *condor* chiefly inhabits the elevated pinnacles of the Cordilleras. It is commonly referred to the vulture species, though its great strength and vivacity are supposed to give it some claim to rank with that of the eagle. No bird that flies can be put in competition with it, either for size, for rapacity, or for rapidity in flight. It measures across the wings from 12 to 13 feet; and the Indians assert, that it will carry off a deer or a calf in its talons with as much ease as an eagle would a hare or a rabbit. Its beak is so strong as to pierce the body of an ox, and two condors are capable of devouring that animal. All the birds of this region, according to Azara, may, in general, be said to be *insectiferous*, as even the birds of prey feed more upon insects, frogs, toads, vipers, &c. than upon quadrupeds and other birds; and those birds whose form announce them to be granivorous, eat more insects than any other kind of food, which, however, may arise from the scarcity of grain in this uncultivated country.

The profusion of vegetable productions in this viceroyalty is commensurate with its extent and the diversity of its climate; and it would be impossible, within the bounds of one article, to give any adequate idea of their variety. Its trees are suited for every purpose of naval or domestic architecture, and many of them are extremely valuable for their beauty and duration. Various medicinal gums exude from their stems;

and their fruit constitutes a considerable proportion of the food of the natives. Valerian, meum, salsaparilla, an aromatic and pungent root called *achyranth*, ginger, and many others of spontaneous growth abound in this country; and extensive forests of trees, producing the Jesuits bark, are found in the province of Los Charcas. The herb of Paraguay, a species of tea, which is chiefly cultivated in the eastern part of that province, and in the vallies among the mountains of Maracayu; is in great request over all the southern continent of America. The Creoles drink it at every meal, and never travel without a sufficient supply of this favourite beverage. Its use, however, is most universal in the mine countries, as the Spaniards suppose that wine there is prejudicial to the health. Like opium, it gives sleep to the restless, and stimulates the spirits of the torpid; but, when taken to excess, brings on similar disorders to those which are produced by the immoderate use of strong liquors. The profits arising from the cultivation of this plant belonged formerly to the Jesuits, but since their expulsion have fallen into the hands of the crown, and are estimated at the annual amount of 500,000 piastres.

At the first establishment of the colony of Buenos Ayres, the precious metals constituted the principal exports of Spanish America. Allured by the prospects of immediate wealth, the Spaniards disdained to dissipate their industry on objects of inferior importance; and the only productions of the climate, which they raised, were such as, from their rarity and value, were in great demand in the mother country. Commodities no less valuable, and of greater utility, were neglected and despised. The culture even of the vine and the olive, and the establishment of several kinds of manufacture, were prohibited under the severest penalties. Their luxuries, their cloths, their furniture, even their instruments of labour, and a considerable quantity of their provisions, were imported from Spain; for which they gave in exchange the produce of their mines and plantations. This traffic was carried on exclusively in Spanish bottoms, and confined entirely to the ports of Porto Bello and Vera Cruz, in the Gulf of Mexico. No vessel belonging to the colonies was allowed to trade with Europe; and even the commercial intercourse between each other was either entirely prohibited, or fettered with the most jealous restrictions. In this state of things, Buenos Ayres languished in obscurity. She had become the object of jealousy and distrust to the mother country, on account of her appropriate situation for an extensive trade; and the Spaniards, fearing lest European commodities should be introduced into Peru and the other provinces through this channel, obtained a decree from government, prohibiting every kind of commerce by the river La Plata. This measure excited great discontent in the southern colonies, who were thus deprived of every spur to industry and agriculture; and were reduced to a state of inaction, very ill suited to their important station, and territorial resources. It was not, however, until often repeated applications had been made to the Spanish government, that the offensive prohibition was withdrawn, in 1602, and they received permission to export in their own vessels, and on their own account, 2,000,000 fanegas of flour, 500 quintals of dried meat, and the same quantity

of tallow. But this stated grant, which was to continue in force only for six years, was loaded with restrictions. The destination of their vessels was confined to Portuguese Brazil and the coast of Guinea; and it was from these countries alone that they were allowed to import such commodities as were merely necessary for their own consumption. At the expiry of this period, these colonies demanded that the permission should extend to every kind of merchandize, and that they should also be allowed a direct communication with Spain. This demand, however, was violently opposed by the consulates of Lima and Seville; and it was consequently restricted to two vessels, not exceeding 100 tons each. But such was their dread of any contraband traffic between this settlement and the other provinces, that a custom-house was established at Cordova-del-Tucuman, which prevented the introduction of all imported commodities into the interior of Peru, under a duty of fifty per cent.; and also the drawing of gold and silver from Peru for Buenos Ayres, even for the payment of the mules which the latter place annually furnished to the former. Notwithstanding, however, the numerous restrictions and barriers of fiscal regulation, a considerable contraband trade was carried on with the Portuguese of St Sacramento; which, though often interrupted, was always renewed and preserved some degree of activity in the settlement. But it was not until 1778, when a more enlightened policy began to prevail in Spain, under the ministry of Galvez, when Buenos Ayres was erected into a separate viceroyalty, and a free trade was allowed with the mother country and the interior of Peru, that it began to acquire importance and stability, and to assume its appropriate station of a commercial emporium. From this time, the general commerce of La Plata rapidly increased; and, by a royal ordinance of the 10th of April 1793, salted meat and tallow were permitted to pass to Spain and the other colonies, free of duty.

The following Tables, given by Azara, present a statement of the maritime commerce of the Rio de la Plata, taking the mean result of five years from 1792 to 1796. The valuations are according to the tariffs of the custom-houses in these colonies.

DETAIL OF COMMODITIES WHICH CONSTITUTED
THE ABOVE 47 CARGOES.

Ox hides in the hair	-	-	758,117
Tanned hides	-	-	1,626
Horse hides	-	-	15,760
Fine furs	-	-	26,197
Sheep skins	-	-	231 dozen.
Tallow	-	-	25,332 arabas.
Salt beef	-	-	1,432 quintals.
Salt pork	-	-	46 do.
Ox horns	-	-	323,000
Horse hair	-	-	146 arabas.
Vicunna wool	-	-	18,408 pounds.
Guanaco wool	-	-	2,744 do
Common wool	-	-	2,745 arabas.
Goose wings	-	-	10,209
Flour	-	-	701 quintals.
Jesuits bark	-	-	54 arabas.
Whale oil	-	-	340 do.
Copper	-	-	2,114 quintals.
Tin	-	-	10 do.

IMPORTS FROM THE HAVANNAH.

Sugar	-	-	13,037 arabas.
Confections	-	-	37 do.
Honey	-	-	132 jars.
Cocoa	-	-	65 arabas.
Coffee	-	-	225 do.
Brandy	-	-	1,277 casks.
Rice	-	-	240 quintals.
Wax	-	-	505 arabas.
Pitch and tar	-	-	37 quintals,
Linen	-	-	473 $\frac{1}{2}$ pieces.
Manna	-	-	96 pounds.
Dye-woods	-	-	37 $\frac{1}{2}$ quintals.
Acana wood	-	-	188 do

Total value in piastres 96,944

EXPORTS TO THE HAVANNAH..

Silver in piastres	-	-	17,236
Salt beef	-	-	39,281 quintals.
Tallow	-	-	10,617 arabas.
Fine furs	-	-	147
Sea-wolf skins	-	-	323
Common wool	-	-	80 arabas.

Sheep skins	-	-	-	113 dozen.
Flour	-	-	-	440 quintals.
Oil of the sea-wolf	-	-	-	25 do.
Copper	-	-	-	50 do.
Goose wings	-	-	-	70

Total value in piastres 71,563

IMPORTS FROM LIMA.

Sugar	-	-	-	4337 arabas.
Cocoa	-	-	-	295 do.
Cinnamon	-	-	-	75 $\frac{1}{2}$ pounds.
Rice	-	-	-	80 quintals.
Salt stones	-	-	-	200
Indigo	-	-	-	138 pounds.
Wrought iron	-	-	-	7

Total value in piastres 25,045

EXPORTS TO LIMA.

Paraguay tea	-	-	-	2688 arabas.
Tallow	-	-	-	2800 do.
Swan skins	-	-	-	20
Negro slaves	-	-	-	83
Hoes	-	-	-	419
Thread	-	-	-	128 pounds.
Silk stockings	-	-	-	8 dozen.
Hats	-	-	-	24

Total value in piastres 22,454

IMPORTS FROM THE COAST OF AFRICA.

From these statements, it appears that the productions of this extensive and fertile country constitute a very inconsiderable proportion of its articles of exportation. They scarcely amount to a third of its imports, the excess being paid in the precious metals. It will also appear, however, that, by the produce of its mines,

the balance of trade in favour of this viceroyalty, amounts to nearly two millions of piastres.

Though in the foregoing Tables we have given the mean result of five years, yet we may observe, that, during that period, the trade of the viceroyalty had considerably increased. According to Mr Helms, in the last of these years (1796,) the exports to Spain, the Havannah, Lima, and Guyaquil, amounted to 5,286,142 piastres; and the imports from the same place to 3,027,660 piastres, besides the traffic to the coast of Africa. In the following years, however, by the involvement of Spain in hostilities with Britain, the trade of this viceroyalty had experienced a considerable stagnation. In 1798, many kinds of European goods, particularly linens, had risen to a most exorbitant price. Brandy and Spanish wines were not to be procured; and above three millions of hides were lying in the warehouses of Buenos Ayres and Monte Video. But from this embarrassment they were much relieved by the contraband trade which they entered into with the Americans, and which was found to be so indispensable to the interests of the colony, that it was either connived at, or openly encouraged; and, indeed, such was the advantage which they derived from this traffic, that their accumulated stock of hides was in a few years reduced to little more than the annual average supply.

According to M. Humboldt, the exports from this settlement in 1803, to Spain alone, amounted to 5,000,000 of piastres in specie, and 2,000,000 in agricultural produce; and the imports from that country were valued at 3,500,000 piastres.

In addition to the maritime commerce of this viceroyalty, we may mention the internal traffic which is carried on between its various provinces and the viceroyalties of Chili and Peru. Of this traffic, the herb of Paraguay constitutes the most important branch. One hundred thousand arrobas of it pass annually into Peru, and 40,000 into Chili. It is conveyed in covered wagons drawn by oxen from Santa Fé to Jujui and Mendoza, and from thence is carried on the backs of mules to Potosi, La Paz, Peru, and Chili. Four piastres per aroba is the common price of this article in Paraguay; at Potosi, however, it brings from eight to nine piastres, and the price increases in proportion as it proceeds. Immense droves of cattle also pass into Peru; and 60,000 mules of two years old are annually purchased in the viceroyalty for that country. In 1789, Buenos Ayres received from Peru, productions, consisting of brandies, wines, grain, sugar, cotton, oil, pimento, baize, and other woollen manufactures, &c. to the amount of 2,034,980 piastres; while her returns in mules, sheep, black-cattle, jerked beef, hides, wool, tallow, wax, soap, cocon, copper, tin, &c. were valued only at 864,790 piastres, being a balance in favour of Peru of 1,170,190 piastres. This balance, however, arises chiefly from the circumstance, that the provinces bordering on Peru are the principal mine countries, which are more populous and more sterile than the surrounding districts, and consequently require a larger quantity of productions than they can give in return. But the augmented importation of European merchandise into the La Plata in succeeding years, tended greatly to reduce this balance, which may now be estimated at four or five hundred thousand piastres. Besides Paraguay tea, Chili draws from Buenos Ayres the greater part of her European merchandise, wax, tallow, mules, cotton, &c.; and sends

in return woollen stuffs, particularly *ponchos* ready made, wine, brandy, snuff, sugar, copper, and cordage.

The traffic which the Spaniards carry on with the unsubdued Indians is very considerable, and consists principally in the exchange of European commodities for the different productions of the country. From the tribes that dwell on the confines of the provinces of Paraguay and Buenos Ayres, they derive Paraguay tea, and fine furs. Some gold of a very superior quality, which is supposed to be collected among the mountains, and upland springs on the banks of the Uruguay, has lately been brought to the Buenos Ayres by those Indians, who contrive to barter it in a contraband way with the Americans or other foreign merchants. From the Pampas Indians and Puelches they buy horses and cattle, furs, guanaco skins, and sometimes their children for slaves. These purchases, however, are generally made in the interior by Spanish adventurers, or converted Indians, who carry thither the articles of barter, and negotiate with the chiefs for the value of their commodities. The good faith and integrity of these tribes has been particularly remarked by travellers, who have visited this country; and we extract for the information of our readers, the following account of the mode in which mercantile transactions are carried on with the Puelches, from Wilcocke's *History of Buenos Ayres*. "The adventurer who engages in this traffic, on his arrival in the tribe, repairs to the cacique, and presents himself before him without saying a word: the cacique begins by saying, 'So you are come.' The Spaniard answers, 'Yes, I am come.' Then the cacique says, 'What have you brought me?' The answer is, 'A present of wine,' of clothing, or some other article. The cacique then bids the stranger welcome, and provides him with a lodging near his own residence, where all his wives and children then go to bid him also welcome, expecting each a present, which however trifling, must be given them. In the mean time the cacique causes a horn to be sounded, to advertise his dispersed subjects of the arrival of a merchant, with whom they may trade; they flock around at that signal, and examine the goods which are brought, and which consist of knives, hatchets, combs, needles, thread, looking-glasses, ribbons, &c. When the barter is agreed on, the Indians take away their goods without paying, and the merchant thus delivers all his goods without knowing any one of his debtors, and without seeing many of them, as those who come to his tent buy not only for themselves, but also for their neighbours. After a reasonable time, the Spaniard wishing to return, the cacique causes his horn to be again sounded, which is a signal for payment to be made. Each then brings in faithfully what has been agreed upon; and the cattle, in which the purchases principally consist, are driven by Indians, sent for the purpose, as far as the frontiers of the Spanish territory."

The inhabitants of this extensive viceroyalty may be divided into four classes. 1. The European Spaniards, or those born in Old Spain, and the Creoles, or Spaniards born in America. 2. The *mulattos* and *meztizos*, or people of colour. 3. Negroes, or Africans; and 4. Indians, or the original inhabitants of the country. Of these, the European Spaniards hold the first rank, and generally fill all the offices of trust and profit in the colonies. They also constitute the most industrious and wealthy part of the population; and the principal trade of the country, both with the interior provinces and with

Spain, may be said to be in their hands. Many of the Creoles are descended from the conquerors of the new world, and inherit extensive and valuable paternal estates. Possessed of ample fortunes, and applying themselves neither to the pursuits of literature, or the avocations of commerce, they waste their lives in luxurious ease and sensual indulgence. The strictest equality reigns among this class. They acknowledge no invidious distinctions of rank. They have neither titles, entails, nor feudal tenures; and the only difference that exists is purely personal, and arises from the fortune or reputation of the individual. No white would condescend to serve the richest noble of his nation; and the viceroy himself must be contented with the service of negroes, men of colour, and Indians. In manners, however, the citizens differ considerably from the inhabitants of the country. Buenos Ayres, Montevideo, Maldonado, Assumption, Corrientes, and Santa Fé, present the same scenes of indolence, vice, voluptuousness, and dissipation, as prevail in the capital of the mother country, but carried perhaps to a greater excess. To sleep, to walk, to ride, and to smoke segars, is their constant occupation; and the facility which this country affords to the lowest of its inhabitants, of obtaining a livelihood without any toil, and the many opportunities which it offers of even acquiring a fortune, encourage them in their native listlessness and idleness. Little cordiality, however, exists between the European and American Spaniard. The jealousy of the Spanish court for the security of her American possessions, which induces her to entrust the government of her colonies entirely to Europeans, to the utter exclusion of the Spanish Americans, has given rise to a deep rooted hatred and suspicion between those two classes of her subjects. While the Europeans look down upon the Creoles as beings of a different order, they return it with equal contempt, and also with sentiments of the most decided aversion, which they even extend to the laws and government of the parent state. "Such is this aversion," says Azara, "that it exists often between a father and his children, a husband and wife, if the one be European and the other American." He, however, adds, that it is strongest among advocates and bankrupts, and all those who are noted for their indolence, incapacity, and vices. The few who have visited the mother country, and have beheld the various gradations of rank, the insolence of office, and the oppressions and exactions attendant upon an absolute monarchy, return to America, well pleased with the liberty and equal rights which they enjoy in their own country, and cursing the distinctions and tyranny of Europe. This evil arises chiefly from the native indolence of the Spanish American, and the repugnance to all kinds of labour, which is the strongest feature in his character. In his infancy, he imbibes high ideas of his own importance, and is led to believe that worth and greatness consist in having nothing to do. Every species of labour is consequently despised, and even the children of the simple sailor disdain to follow the profession of their father. Monks, priests, advocates, and merchants, are the employments to which the lowest aspire. Even the latter of these is often rejected as being too laborious; and many of the inhabitants spend their existence in listless apathy, low debauchery, or the practice of superstitious ceremonies; and owe their means of subsistence entirely to the facility of procuring them in this rich and fertile country. Yet these Creoles possess very quick parts, and were they not debased by

their education, might be capable of the highest attainments both in science and the arts; but the germs of every good quality and of every virtuous principle are allowed to perish for want of cultivation, or are smothered by dissipation and indulgence. Latin grammar, the peripatetic philosophy, the theology of the Thomists, and a little common law, constitute the studies of their most eminent scholars. The arts and trades are reduced to those which are indispensably necessary, and they are exercised only by some poor Spaniards from Europe, or by people of colour. The Creolian ladies are reckoned much handsomer than the Spanish; the jetty blackness of their hair and eyes contrasting admirably with the brilliant whiteness of their skin. They are all, however, equally indolent in disposition with their husbands, are fond of show, and greatly resemble in manners and in dress the ladies of Old Spain, but less reserved, and more gaudy in their ornaments. But with all their external magnificence and costliness of dress and furniture, the Spaniards, within doors, in this quarter of the world, are described as filthy in the extreme. "Ablution of any kind is never, or very negligently performed. Flies, and various kinds of vermin, are abundant plagues in every house; and the ravages of the ants are only equalled by those of the mice and rats. In their cookery, the bountiful provision of nature is spoiled by the perverted taste of man; and both meat and fish are disguised, and their flavour indiscernible by the accumulation of spice, eggs, oil, onions, and garlic, with which they are dished up."

The Spaniards who inhabit the country, may be divided into the agriculturists and the shepherds. Of the former, however, the number is very inconsiderable, the labour of the employment deterring many from embracing it; and it is in general only followed by those who have not the means of becoming merchants, or of acquiring a sufficient quantity of land for pasture. The shepherds, on the contrary, are numerous, and constitute a considerable proportion of the Creolian inhabitants in this viceroyalty. Their numerous domestic herds, which wander over the plains of Paraguay and Buenos Ayres, are computed by Azara at twelve million of cattle, three million of horses, and a considerable number of sheep, divided among a great many *estancias*, or farms, each possessed by a single proprietor. An ordinary estancia consists of five or six square leagues, and is under the charge of a *capataz*, or master shepherd, and a servant for every thousand cattle, who is either a young Creole, a negroe slave, a man of colour, or a converted Indian who has deserted from some of the colonies. These shepherds, however, never accompany their flocks into the field, as in Europe, but content themselves with merely collecting them once a week, in order to prevent them from wandering beyond the bounds of the estancia. The rest of their time is spent in breaking their horses, but chiefly in the most degraded idleness. Addicted to the grossest vices, and sunk in ignorance and superstition, this race of men seem to have completely forgotten the origin from whence they sprung, and, in point of civilization, are little inferior to the wildest savages of the desert. Their habitations, which are generally situated near the centre of the estancia, are nothing but miserable huts, whose furniture consists chiefly of a cask for holding water, a horn to drink with, a wooden spit, and a small copper vessel in which they infuse the herb of Paraguay. Some, however, have a chair or wooden bench, and a

kind of bed; but the greatest number sit upon their heels, or the skulls of their cattle, and sleep upon skins spread on the ground. Their only food is roasted meat, which they eat without salt, but at no stated hours; pulse and vegetables they consider as no better than grass, and fit only for horses. The offals and bones, which they scatter around their huts, engender an infinite number of flies and noxious insects, and collect a multitude of ravenous birds, which deafen them with their constant cries. Their dress corresponds with the filthiness and meanness of their habitations. Few of the herdsmen have a shirt. A *poncho*, or cloak, which consists of a piece of coarse woollen or cotton stuff, manufactured in the province of Tucuman, about three feet long and two broad, with a hole in the centre for the head to pass through, a hat, a pair of drawers, and half boots formed of the skins which they strip from the legs of their cattle, constitute the whole of their clothing. Besides these, however, the master shepherd, or proprietor, has a doublet, a vest, breeches, and shoes. The dress of the women consists merely of a shirt without sleeves, which is bound round the middle with a girdle; and as they have seldom more than one at a time, when it requires washing, they carry it to the nearest brook to perform that operation, and wait until it is dry. In Paraguay, however, the shepherds are both better lodged, and more decent and cleanly in their apparel than those of Buenos Ayres.

This people are most dexterous horsemen. Indeed, they scarcely know what it is to walk, as they never go any distance on foot. From their infancy, riding is their only instruction and amusement; and they become so habituated to the exercise, that they will keep their seat upon the most furious animal. The principal operations of the estancia are performed on horseback. The weekly gathering of the herds is made at full gallop; but, from the extent of some of the pastures, the cattle are nearly in a wild state, and are hunted and killed in the same manner as the wild oxen in the plains of the Pampas. The common method, however, of slaying their cattle, is to drive a certain number into an inclosure, where the shepherds assemble on horseback, armed with spears in the form of a crescent, a knife, and catch ropes; as many beasts are then turned out as there are men in waiting, when each pursues his prey at full speed. If the bullock be swifter than the horse, the peasant with wonderful dexterity throws his catch-rope round his neck, or entangles one or two of his legs, by which means he easily secures him; but he generally hamstringing him with his spear, and then dispatches him with his knife. This employment is continued every day, until all the cattle appointed for the year's slaughter are killed. They fish on horseback; carry the water from the well on horseback; and even attend mass on horseback, remaining at the church door, which is left open on purpose that they may hear the service. "In short," says Azara, "every thing they do is done on horseback." These shepherds, who are bred in the desert, and hold no intercourse with society, except with the individuals of their own estancia, are little superior in knowledge to the brutes with which they are surrounded. Without education, and under no law or restraint, they give full scope to the indulgence of their desires. Every boundary of modesty is overstepped; and their huts present the most shameless scenes of indecency and debauchery. Accustomed from their infancy to the slaughtering of cattle, which is their chief

occupation, and even amusement, they become so habituated to blood, that they often kill one another upon the slightest provocation, and sometimes, indeed, without any particular motive. They are bound by no ties of friendship for one another, nor of gratitude to their masters, however well they may have been treated. They feel themselves free and independent, always ready to follow their own inclinations, and to maintain their own rights. They leave the estancia whenever they please; and when they have once taken the resolution, no intreaties or promises can induce them to remain. They are, however, very hospitable, and when a stranger happens to come among them, they lodge and entertain him with great civility, without even asking who he is, or where he is going. From the great distance of one estancia from another, some of them being from ten to thirty leagues, there are very few churches in these plains, and the shepherds consequently go very seldom to mass; but they have all a violent desire to be buried in holy ground, which the friends of the deceased seldom fail to fulfil. Those who are very far from the church, allow the dead body to putrify in the fields, after having covered it with branches of trees, or stones, to protect it from ravenous animals; and when there remains nothing but the bones, they carry them to the priest, who gives them sepulture within the precinct of the church. Others cut up the body, and after carefully separating and cleaning all the bones, and throwing away or burying the flesh, they carry them to the priest. But if the distance does not exceed twenty leagues, the deceased is dressed in his best clothes, and placed on horseback, with his feet in the stirrups, and supported with two pieces of wood fastened together in the form of a St Andrew's cross, is carried in procession to the place of burial. Though we have represented these shepherds as consisting generally of Creoles, or Spanish Americans, yet we may observe, that there is among them a considerable intermixture of the other classes; and that even some of the proprietors are free blacks, or men of colour.

The second class, or people of colour, consists of *mulattos* and *mestizos*, with their various collateral branches, from the dark shade of the African to the bright hue of the European. A mulatto is the issue of a white and a negro; and a mestizo of a white and an Indian; and the descendents ramify into an endless multiplicity of varieties, which the Spaniards pretend accurately to mark and to define, but which it would be folly to enumerate. This mixed race constitute the most robust and useful class of the community. The mechanic arts, the retail trades, and the other active functions of society, which the higher class, from pride or indolence, disdain to exercise, are chiefly carried on by them; and almost all the hired servants are taken from this class. Among them are also found professors and teachers of the liberal arts. The females, however, particularly the mulattos, too frequently devote themselves to meretricious allurements. They dress with great neatness, possess a considerable share of wit and vivacity, and often acquire an ascendancy over their paramours, which the Spanish or Creolian women seldom attain.

The negroes constitute the third class of inhabitants in this viceroyalty; and though the Spaniards do not themselves engage in the detestable traffic in human flesh to the African coast, yet they are so far partakers in it, that they make no scruple in buying those that are

brought by others. The treatment, however, which this unfortunate race experience in the Spanish settlements, is very different from what their brethren receive in our West Indian colonies. "They form," says Wilcocke, "a principal part of the train of luxury, and are cherished and caressed by their superiors, to whose vanity and pleasures they are equally subservient. Their dress and appearance are hardly less splendid than that of their masters, whose manners they imitate, and whose passions they imbibe. Elevated by this distinction, they have assumed such a tone of superiority over the Indians, and treat them with such insolence and scorn, that the antipathy between the two races has become implacable." But this description, we fear, must be confined entirely to those who are employed in domestic service, and that the same attention and humanity will not be shewn to those who are engaged in agricultural labours. By this, however, we do not mean to insinuate, that even these are treated with cruelty or neglect, but merely to regret, that, from the very nature of their situation and employment, they are more exposed to the exaction and tyranny of task-masters, who are often little solicitous about the feelings and comfort of those who are under their controul. Yet we must confess, that slavery is not here such a "bitter draught" as it is in the other American colonies; and that the little indulgencies and comforts which the negro is allowed by his Spanish master, cannot but put to shame our English planters, who, with all their boasted notions of freedom, have reduced this unfortunate portion of their species to the most degraded servitude, and who exact from them their utmost labours, with unmitigated severity. According to Azara, many of the slaves in this settlement never hear the sound of the whip as long as they live; during sickness they are treated with great kindness and attention, and are never forsaken in their old age. They are even better fed and better clothed than the poorer classes of the white inhabitants; and many of them obtain their freedom after a short period of service. We are sorry, however, to observe, that this humane conduct has not been extended by the Spaniards to another class of their American subjects, the converted Indians, who cannot be said to be less deserving of their attention and kindness.

Notwithstanding the constant solicitude of the Spanish court for the security and preservation of her Indian subjects, and the many regulations which have been made in their favour, this class still groan under many arbitrary and oppressive exactions. The wrongs and insults which they have been made to endure, have completely estranged their affections from their conquerors. They shrink from the voice of a Spaniard, and cherish against him the most bitter but secret animosity. On the first conquest of their country, the Indians were parcelled out into departments, or *encomiendas*, which were divided among their conquerors, under whose authority they continued for a certain number of years. At the expiry of this period, they devolved to the crown; who either employed them in public works, or made them over to other private individuals. The service demanded by their oppressors, consisted in their labouring for two months in the year in whatever way they chose to employ them, and to pay out of their earnings during the other ten months, an annual tribute of five piastres, from which, however, those who were under eighteen or above forty were exempted. In return for this, the *encomandero* was bound to provide

them with necessaries, and to have them instructed in the Christian religion. But this severe bondage, and the cruelties with which it was attended, had so reduced this class of the American population, that the evil called for some immediate remedy. The Spanish court accordingly appointed officers, with power to deprive of their *encomiendas* such as could be proved to have been oppressive in their exactions, or tyrannical in their treatment of the Indians; and the nature and extent of the services which they might be required to perform, were precisely ascertained. The facilities, however, of evading such distant authority, and of corrupting those who were entrusted with the execution of its commands, rendered the wisest precautions and laws but weak barriers against avarice and oppression. The same evils continued to prevail, and were the occasion of some formidable insurrections, until many of the *encomiendas* had reverted, and were annexed to the crown. Their condition is now greatly ameliorated, and their services are very different from those originally demanded. The tribute has been reduced to a piastre a head; and it is only in works of primary importance, that they can be compelled to labour: in the culture of maize and other grain of necessary consumption; in erecting buildings of public utility; in forming roads; in tending cattle; and in working the mines; which last task is confined entirely to those Indians who reside within 30 miles of the ore. This labour, however, is most burdensome and deleterious. It annually destroys a large proportion of the inhabitants, either by a rapid mortality, or by engendering the germs of a slow but certain destruction. Those who are liable to employment are called out by divisions, or *metas*, but the number must not exceed the seventh part of the population of the district; and no one can be compelled to go but in his turn. Such as are destined for the mines remain there for six months, and are paid at the rate of four reals per day. In spite of the numerous regulations which have been framed, in order to guard the Indians against the tyranny of their masters, they are still exposed to several arbitrary and burdensome exactions. Unreasonable tasks are often imposed, and the term of their labour is frequently prolonged beyond the legal time. It is only in the more remote districts, where there are but few Spaniards, that they enjoy any degree of relaxation from oppression. In these districts, some of them are even in affluent circumstances, possessing numerous herds, and working mines for their own benefit. From the exuberant fertility of their country, and their knowledge of some of the European arts, they have risen to a state of comparative civilization, and are plentifully supplied, not only with the necessaries, but with many of the luxuries of life.

The general characteristics of the Indians are indolence and apathetic indifference. Their tasks are performed with the greatest reluctance, and require the constant attendance of overseers. Promises cannot induce, nor punishment scarcely compel them to exertion. Their only domestic labour consists in the ploughing of their *chacara*, or piece of ground; but the sowing and the rest of the culture, and indeed every other kind of work, is left entirely to the women, who spin, make their apparel, grind the barley, and brew the *chica*, an inebriating beverage, made from maize, of which all the Indians are particularly fond. Their perseverance, however, is proverbial among the Spaniards; and when any work of trifling importance is to be performed, which requires much time and patience, they say that

it is only fit to be done by an Indian. They are devoid of every species of ambition or emulation, and now seem perfectly indifferent to their situation. They are seldom heard to complain, either in pain or sickness. They endure punishment without discovering the smallest symptom of sensibility; and even view death with the most perfect unconcern. This part of their character, however, may with justice be ascribed to the operation of an enervating and degrading bondage. It is only at their drinking entertainments, that they shew any disposition to exert themselves. Every kind of reserve or restraint is then thrown aside, and the night is spent in the most indecent and intemperate mirth. No ties of conjugality or relationship are regarded, and though, on other occasions, the chastity of their married women is an object of solicitude, yet it is a received maxim among them, that the husband must not resent the privileged familiarities of these orgies.

Of the unsubdued Indians who wander over this vast expanse of territory, and who have as yet resisted the yoke of the Spaniards, it is impossible to give any determinate account. The state of almost perpetual hostility in which they live with the Europeans, has considerably prevented the researches of modern travellers. The discordant relations which have been handed down to us by their conquerors concerning their appearance, their manners, and their internal policy, and which seem to be more the effusions of ignorance and prejudice, than the minute details of historical truth, afford us little opportunity of extracting a correct and simple representation. Independent, however, of the scantiness of our information on this subject, the numerous nations into which these Indians are split, and the diversity of their language and manners, would forbid all attempts at any very particular details in this work. While some of these nations wander through their forests in a state of perfect nudity, unacquainted with every species of cultivation, and living on berries and roots, or depending for subsistence entirely upon fishing and the chase; others practise a rude kind of agriculture, which, from the fertility of the soil, supplies them with abundance; and display considerable ingenuity both in the fabrication of their dress and their instruments of war. Some have been represented as stupid, cowardly, treacherous, and cruel; while others have been found to possess considerable penetration and judgment, to be sincere, industrious, and brave. Many of the independent nations which inhabit the eastern borders of the Paraguay and Parana, though formerly numerous and formidable, are now reduced to inconsiderable tribes, who, with little power of annoyance, still bear an invincible enmity to the Spaniards. Among these, the most powerful were the *Charruas* and *Minnanes*, who long withstood, with the most determined resistance, the subjugation of their country. Though now driven from their ancient residence on the banks of the La Plata, and reduced to a few hundred warriors, they still carry on incessant hostilities with the Europeans, either in Brasil or Buenos Ayres. They live in a state of continual watchfulness. At evening the heads of families assemble to appoint the sentinels for the night; and such is their foresight, that this precaution is never forgotten. At this assembly they arrange their plans of attack and defence, and all projects for the public safety and welfare are here communicated and discussed, and, if approved of, immediately put in execution. When a military expedition is resolved upon,

VOL. IV. PART II.

they conceal their families in the woods, and send out their spies, well mounted, to discover the situation and strength of the enemy. If they find him weak or unprepared, so that he may be attacked with any prospect of advantage, they dispose their forces in such a manner as to assail him at several points at once; and then, advancing slowly and in silence, precipitate themselves with such sudden fury upon their opponents, that time is scarcely left for resistance. Every male above twelve years of age is massacred, and the women and children are carried off as prisoners, who, however, enjoy among them the most perfect liberty, and soon become so habituated to their manner of life, that they seldom wish to return to their former companions. They are also most dextrous in laying ambuscades, and in making false attacks; but generally content themselves with a single victory, and never follow up their advantages. If repulsed, they easily escape by the superior swiftness of their horses, which they manage with great address. Their warlike accoutrements consist merely in a long spear, pointed with iron, which metal they buy from the Portuguese; and a quiver full of short arrows slung over their shoulders. They go entirely naked, except when they can obtain a poncho, or hat, which they wear in cold weather; and their women cover themselves with a cloak, or cotton shirt, which their fathers or husbands may have taken from the enemy. They are altogether unacquainted with agriculture, and live entirely upon the flesh of the wild oxen, with which their country abounds. They have neither chiefs nor laws. All are equal; and every one retains the booty which he has personally taken in war. But though few in number, they are actuated by such a spirit of unanimity and determined hostility against their oppressors, that their reduction has cost the Spaniards more blood than even the conquest of Mexico and Peru.

The same unconquerable inveteracy against Europeans prevails among the numerous independent nations which rove over the plains of Chaco. They are in general of a robust and lofty stature, are immoderately addicted to *chica*, and often terminate their carousings by sanguinary quarrels. War and pillage is their only occupation. They are excellent horsemen, and their principal weapon is a wooden javelin with a barbed point made of deer's horn, which they use with great strength and dexterity. They take off the scalps from their enemies, and display them at their entertainments, as memorials of their victory. North of Chaco are the *Chiquitos*, who are by far the most civilized and industrious nation of independent Indians. They sow maize and rice, and plant sugar canes, tobacco, and cotton. The dress both of men and women, consists simply of a kind of cotton shirt, and both wear the hair long, by way of ornament. They are brave, and dextrous in war, and treat their prisoners with great humanity, adopting them into their families, and giving them their daughters in marriage. Drunkenness, however, is their ruling passion, to which they are habituated from their infancy; and from the great heat and humidity of the climate, they are subject to several dangerous diseases, which often appear among them like a pestilence.

The *Moxos* are a numerous nation, extending towards the north west. They imbue the points of their arrows with the most active vegetable poisons, and sell their prisoners taken in war for slaves. A barbarous practice prevails among them, of interring young children

5 II

with their dead mother, as no other woman can be found to take charge of them; and when twins are born, one of them is always destroyed. They are more jealous of the honour of their wives, than any of the other American nations; and with them adultery is often punished with death. Among the Manoa tribes, the same custom prevails of poisoning their weapons; and when a male child is born with distorted limbs, or any other remarkable defect, he is instantly deprived of life. They cultivate a kind of root called *yuca*, of which they make their principal beverage, as they seldom taste water; which, in consequence of the heat, and of the innumerable morasses, is of a noxious quality. They also raise cotton for the manufacture of their garments. Their towns are generally built against the side of a hill, in the form of a half moon, and are fortified with considerable art.

The unsubdued Indians who dwell along the frontiers of Tucuman and Chili, and south of the provinces of Cuyo and Buenos Ayres, go under the general denomination of Moluches and Puelches. These, however, are divided into a variety of independent tribes, concerning which our information is yet very defective. The *Pamphas* are the most powerful, and best known to Europeans. They inhabit the immense plains which stretch between the Rio de la Plata and the Chilian Cordillera, and long disputed, with admirable constancy and valour, the first establishment of a colony at Buenos Ayres. They compelled the Spaniards to abandon, for a time, their intended settlement; and though this was afterwards accomplished, and many fierce and bloody wars were the consequence of it, yet they have still maintained their independence. They are now at peace, and carry on a kind of commercial intercourse with the inhabitants of Buenos Ayres. They bring hides and ostrich feathers, which they exchange for brandy, Paraguay tea, sugar, spurs, knives, &c.; and their caciques sometimes pay a visit to the viceroy, who receives them with kindness, and generally dismisses them with a small present. The men seldom wear any covering, except when they come to visit the Spanish settlements; but the women are fond of ornaments. They have necklaces and ear rings, and a great profusion of jewels, which, however, are seldom of any value, and their ponchos are sometimes studded all over with thin circular pieces of copper, of about four inches in diameter.

Much has been said about the religion of the American Indians, but nothing is known with certainty on this point. Their languages have so little affinity to those of Europeans, that it is almost impossible to express, by any letters, their words and sounds; and equally difficult to define, with any degree of exactness, their absurd and incongruous ideas. For information on this subject, however, we may refer our readers to Willcocks's history of this viceroyalty; and for a more particular account of the manners, customs, &c. of the independent Indians, we refer to Azara, who lived several years among some of these nations, and who was an eye-witness of many of the circumstances which he describes. In his *Travels in South America*, will also be found much valuable information respecting the natural history and statistics of this country.

We shall now proceed to give a short narrative of the discovery and conquest of the viceroyalty, with a hasty sketch of its modern history.

The accidental discovery of Brasil by the Portuguese

Admiral, Cabral, on his way to the East Indies, in 1500, was the first circumstance which led to the exploration of the South American continent. In the following year, Americus Vesputius coasted along its eastern shore as far as the 52d degree of south latitude; but was compelled, by the coldness and tempestuousness of the weather, to return to Portugal, without making any discovery of importance. In 1516, Juan Dias de Solis, grand pilot of Castile, who had been entrusted, by the court of Spain, with an expedition, consisting of three vessels, for continuing the discovery of Brasil, first entered the Rio de la Plata, to which he gave his own name. Fearful, however, of venturing far up the river with his squadron, on account of the difficulty and danger of the navigation, he sailed along its northern coast in his long-boat; and discovering some savages on the beach, who, by their gestures and signs, seemed to invite him on shore, he imprudently landed with a few men, and without taking any precautions for his safety. He and his followers were immediately massacred and devoured by the Indians, within sight of their companions, who remained in the boat, but who were unable to afford them any assistance. The expedition returned to Spain, and this discovery was for some years neglected or forgotten.

The first attempt of the Portuguese to explore the interior of this continent, was equally unfortunate. The reports of the immense riches which the Spaniards had gained in Peru, had reached the ears, and excited the avarice, of the governor of Brasil. He dispatched Alexis de Garcia, a man of courage and ability, to penetrate, by an overland journey, into that country. Garcia, with his son and only three Portuguese companions, constituted the expedition. They reached the Paraguay, and engaging a number of Indians, whom they found upon its banks, to follow them, they passed that river, and entering the empire of Peru, collected some gold and a considerable treasure in silver. Returning to the Paraguay, Garcia, with a view of establishing a settlement in the country, dispatched two of his companions to Brasil with an account of his journey, and some ingots of gold and silver as evidences of his success. Sixty Portuguese, and a party of Brasilians, were immediately sent, under the command of George Sedenno, to form the new colony; but before their arrival, Garcia with his companions had been massacred by the natives, who had made his son a slave, and taken possession of all his treasure. These Indians had suspected his design, but determined to resist the intrusion of strangers into their country. The Portuguese were consequently so harassed upon their march, that they found it impossible to proceed; and after losing their commander and several men, they retreated towards the Parana, in attempting to cross which, most of them were drowned.

These disasters prevented, for a time, any similar attempts at conquest in this quarter, until 1526, when Sebastian Cabot, grand pilot of Castile, who had been dispatched by the Emperor Charles V. upon a voyage of circumnavigation by the Straits of Magellan, anchored in the La Plata, then called Rio de Solis, near the islands of San Gabriel. Having received the most flattering description of the riches and beauty of the country from some Spaniards whom he found in the port of Patos, and who had deserted from the army of Solis, he determined to relinquish the original object of the expedition, and to accomplish farther discoveries upon the

Paraguay. After an unsuccessful attempt of one of his captains to explore the river Uruguay, which he took for the true Rio de Solis, he proceeded up the Parana, and built a small fort at the mouth of the Rio Tercero. This fort he garrisoned with sixty soldiers, and called it Santi Espiritu, or the *Fort of the Holy Ghost*. He then followed the course of the river as high as 27½ degrees of latitude, where he met with some Indians, who wore in their ears small pieces of gold and silver. These they exchanged with the Spaniards for some European trifles, but could give them no information where these metals were to be found, except that they had received them from some of the tribes upon the Paraguay. Cabot immediately mounted that river, but a party of his men being cut off by the natives, who had deluded them on shore, with the promise of shewing them their riches, he returned to Santi Espiritu. Satisfied that the pieces of gold and silver which he had obtained from the Indians on the Parana, were the produce of the mines in the neighbourhood, he gave to the river the name of Rio de la Plata, or *River of Silver*; and dispatched Ferdinand Calderon to Spain, to inform the emperor of his discoveries and operations. The emperor was so delighted with the appearance of the pieces of silver, which were the first that had been brought from America to Spain, that he not only approved of Cabot's deviation from his original instructions, and of all that he had hitherto done, but he ordered a great armament to be fitted out for accomplishing the complete conquest of the country. Six years, however, elapsed before this armament was ready for sea; and, during that time, the fort of Santi Espiritu had been destroyed, and the country entirely evacuated by the Spaniards.

Cabot, after waiting two years, and despairing of reinforcements, resolved upon returning to Spain, and appointed Nuno de Lara governor of the fort in his absence, with 110 men. Hitherto a good understanding had been carefully cultivated with the natives, who frequently visited the Spaniards, and supplied them plentifully with provisions; and since the departure of Cabot, Lara had assiduously applied himself to promote and to maintain it. Its continuance, however, was not of long duration, and was interrupted by a circumstance equally unforeseen and unsuspected. Mangora, cacique of the Timbuez, in the course of his frequent visits to Lara, had become violently enamoured of Miranda, a Spanish lady, and wife of Hurtado, one of the principal officers of the fort. Accustomed to the unrestrained indulgence of his inclination, the Indian thought only of getting her into his power; and frequently pressed Hurtado to pay him a visit, and bring his wife along with him. The lady, however, had suspected the design of Mangora, and warned her husband of her apprehensions; but as it was the interest of the Spaniards to live in good terms with the cacique, Hurtado declined the invitation in the politest manner. But the Indian was not to be duped by this evasion, and determined, as he could not succeed by cunning, to accomplish his purpose by force. He accordingly chose an opportunity when Hurtado was absent with a detachment of forty soldiers in search of provisions, to surprise the Spanish garrison. Having posted a body of his bravest subjects in ambuscade near the fort, he ap-

proached with a few followers under the friendly pretence of bringing refreshments. Mangora was received as usual with every demonstration of cordiality; but he had no sooner gained the gate, than he gave the signal to the ambuscade, when the fort was immediately filled with Indians. A dreadful scene of carnage ensued. Every Spaniard was massacred, but in the midst of the slaughter the treacherous cacique fell by the hand of Lara. Miranda, four other women, and four children, the only survivors, were carried before Siripa, the brother and successor of Mangora, who being also struck with her beauty, conceived the same violent passion for her which had proved so fatal to his brother. His behaviour, however, was tempered with a gentleness and lenity, which could not have been expected from a savage; and though she repelled all his offers with the utmost disdain and acrimony, yet he continued to treat her with great moderation and respect.

On the return of the convoy to the ruins of Cabot's fort, Hurtado, not finding the body of his faithful Miranda, and impelled by conjugal affection, set out alone to seek her among the Indians. Siripa, indignant at his presumption, and conceiving him the only obstacle to his happiness, ordered him to immediate execution; but Hurtado was saved by the intercessions of his wife. The Indian, however, worn out at last by her resistance, and his own jealousy, commanded them both to be destroyed.* Mosquera, upon whom the command of the few surviving Spaniards had devolved, was compelled, by the irreconcilable animosity of the Indians, to abandon the fort, and retired to the coast of Brasil.

Such was the situation of affairs in Paraguay when the Spanish armament arrived in 1535, under the command of Don Pedro de Mendoza, who was appointed governor and captain-general of all the countries that might be discovered as far as the South Sea. This armament consisted of fourteen vessels, carrying 72 horses, 2500 Spaniards, and 150 Germans, Flemings or Saxons. The first care of Mendoza was to select a convenient station for a new settlement, and having fixed upon a spot on the south bank of the river, he there founded the city of Buenos Ayres, on the 2d of February 1535. The natives, who at first brought provisions, and seemed well disposed towards the Spaniards, soon shewed a determined hostility to the settlers. They cut off their foraging parties, intercepted their provisions, and massacred every European whom they found straggling in the country. They even attacked the city, killed thirty Spaniards, and burnt almost all the houses. This opposition, added to the ravages of famine and disease, which had begun to rage in the colony, determined the governor to look out for a more eligible situation for an establishment, and for that purpose proceeded up the river. Having rebuilt the fort of Santi Espiritu, under the name of Buena-Esperanza, he dispatched his lieutenant Ayolas with three barks well manned to continue the voyage; and required him, if he did not return within four months, to transmit an account of his operations and discoveries. Mendoza soon after became dangerously ill, and naming Ayolas his successor in the government, embarked for Spain, but died on his passage. Ayolas pushed up the river, and treated amicably with all the natives whom he met upon his voyage, until he came to the 25th degree of

* This story, which bears evident marks of Spanish romance, is presented to our readers upon the authority of every historian of South America, though we ourselves do not vouch for its authenticity.

latitude, where the Indians declined all kind of intercourse with the Spaniards. He immediately landed his forces, and fought the Indians in the valley of Guarnipitan. They were defeated with great slaughter, and an immediate peace was the consequence, when the Indians not only supplied him with provisions, but also brought seven young females for Ayolas, and two for each of his soldiers. Here Ayolas built a small fort, which he called Assumption, from the day on which the battle was fought, being the 15th of August 1536. Proceeding upon his voyage, he landed at Puerto de Candelaria, in latitude $21^{\circ} 5'$, where being assured by the Guarini Indians, that there were several nations to the westward, who possessed a great deal of gold and silver, he resolved to go in quest of them; and leaving his brigantines under the command of Irala, with orders to wait six months for his return, he penetrated by Chaco and the province of Chiquitos as far as Peru; and returned to Candelaria loaded with treasure. Irala, however, had departed before the appointed time; and Ayolas, attempting to form a settlement among the Payaguas, was surprised and killed, along with all his followers.

While the progress of discovery was thus interrupted on the Paraguay, the colonies on the La Plata were suffering all the horrors of famine. Galan, the governor of Buenos Ayres, had exposed himself, by his severity and oppression, to the universal detestation of the inhabitants; and his arbitrary and perfidious conduct towards the Indians in the neighbourhood of Buena Esperanza awakened all the ancient animosity of the Timbuezes, who drove the Spaniards from that settlement. During these melancholy occurrences, three vessels arrived from Spain with reinforcements under the command of Alphonso Calrera, who also brought out a commission from the emperor, appointing Ayolas governor and captain-general of the Rio de la Plata. In case of his death, however, and no successor being chosen by the chiefs of the expedition, he was enjoined by an imperial Cedula to assemble them for the election of a new governor. For this purpose they met at Assumption in the month of August 1538, when the choice fell unanimously upon Irala. At this meeting it was also resolved to abandon Buenos Ayres, and to concentrate all their forces at Assumption, which had already begun to assume the appearance of a city. But of three thousand Europeans who had entered the La Plata, scarcely six hundred remained to compose the population of Assumption. These, however, were soon afterwards reinforced, by the arrival of four hundred Spaniards, under the command of Don Alvarez, who had been sent out by the emperor to take upon him the government of the Rio de la Plata in case of the death of Ayolas. Irala submitted with a good grace, but set himself secretly to foment divisions among the officers of the garrison, and to procure the removal of his rival. The first steps of the new governor were to secure the friendship of the neighbouring Indians; and by his mild and prudent conduct, he not only gained their affections, but converted many of them to the Christian faith; and by firm and decisive measures he repressed the insolence of those more fierce and savage tribes, who were constantly committing hostilities against the Spaniards. Farther discoveries were also prosecuted on the Paraguay. Irala, with ninety Spaniards, had advanced towards the sources of that river, and anchored at the mouth of the lake Xarayes, in latitude $17^{\circ} 57'$, which he called Puerto de los Reyes.

Proceeding west by land, he fell in with several nations, among whom he found a great deal of wrought gold and silver; but he was unable to discover whence they obtained it.

As soon as Alvarez was made acquainted with this circumstance, he resolved upon undertaking a similar expedition in person, and of opening a way into Peru. Leaving Los Reyes with 300 Spaniards, and provisions for twenty days, he directed his course westward through a woody country, sometimes so impenetrable, that he was obliged to cut a passage for his troops. On the sixth day he reached the banks of a river, whose waters were very warm and transparent. Here several nations sent deputies to him with compliments and provisions, while others attempted to oppose his passage. Proceeding on, he is said to have come to a large town, consisting of 8000 houses or huts, in the centre of which stood a wooden tower, containing a monstrous serpent, which was deified by the Indians. The capture of this town, and the destruction of its divinity, terminated the expedition; for he was compelled to return by the murmurings of his troops, who refused to accompany him farther.

The moderation and upright conduct of Alvarez towards the Indians, and his determined firmness in resisting the avarice and tyranny of his countrymen, had increased the partisans of Irala, who now resolved upon his removal. He was seized on the 26th of April 1544, and afterwards sent prisoner to Spain, accompanied with many grievous accusations, which, however, were never substantiated. But it was not until after eight years delay, that he was fully acquitted, and rewarded with a pension of 2000 gold crowns, and a seat in the council of the Indies, and in the royal audience of Seville.

The humane and temperate proceedings of Alvarez were soon forgotten under the usurpation of Irala. The Indian villages became scenes of pillage and oppression, which produced frequent revolts; and even the Spanish colonists themselves were not free from the rapacity of his soldiery. Tyrannical and suspicious, he was continually surrounded with spies; and imprisonment or death was inflicted upon all, who were suspected of conveying intelligence of his conduct, either to Spain, or the viceroy of Peru. His measures, however, though often severe, were executed with firmness and decision, and tended greatly to the extension of the Spanish power in America.

In 1547, the city of Assumption was erected into a bishopric by Pope Paul III.; but it was not until 1554, that the bishop Francis Pedro de la Torre arrived with his retinue in Paraguay. He was accompanied by three vessels full of men, arms, and ammunition, under the command of Martin de Urua, who brought out a commission from the emperor, continuing Irala in his government; and also various orders and regulations respecting the *encomiendas* and personal services of the Indians. Of these *encomiendas* we have already given some account at p. 792, when speaking of the converted Indians; and though they were intended by the emperor to guard this class of his American subjects against the caprice and tyranny of the Europeans, yet they were often made the instruments of the most cruel bondage. —The number of Indians, already reduced or converted, were insufficient to supply all the Spaniards who laid claim to their services; new settlements were consequently resolved upon, and detachments were sent out to discover proper situations for the establishment of *encomiendas*, and to reduce the natives under their power.

With this view, Ciudad Real was founded in the province of Guayra, in 1557, when 40,000 Indians were trained to habits of industry; and a few years after, the encomienda of Santa Cruz de la Sierra was established in Los Chiquitos, comprehending nearly 60,000 inhabitants.—Of this system, however, Irala did not live long to promote the effects; but being seized with a fever, he died at Assumption in 1557, after nominating his son-in-law, Don Gonzalez de Mendoza, lieutenant-general and commander of the province, until the emperor's pleasure should be known. Mendoza survived his exaltation scarcely a year; and his death was succeeded by rebellions and civil dissensions throughout the province. The Spanish chiefs, ambitious of wealth, and impatient of controul, and far removed from the authority of the parent state, often disputed for pre-eminence. One governor refused to acknowledge the supremacy of another, and frequently retained, or seized by violence or fraud, dignities to which a successor had been appointed. But amidst the fierceness of contention, the Indians found no relief from their intolerable bondage. Exposed to the arbitrary exactions and capricious cruelty of their task-masters, they were fast hastening to extinction; and had not some farther regulations been adopted by the Spanish court, its possessions in this country would soon have been converted into an uninhabited desert. The preservation and increase of the Indian population, however, was chiefly owing to the labours of the Jesuits, who by their mildness and humanity, not only reduced them under the dominion of the cross, but established a political government amongst them, of which promises and persuasion were the principal engines of authority.

It was in 1586 that the Jesuits first made their appearance in Paraguay; though previous to their introduction into this country, they had been many years employed in propagating the gospel in Brasil, which Father Joseph Anchieta, in the phraseology of these times, had filled with the odour of his holiness, and the splendour of his miracles. Their labours, however, were for a time confined merely to the conversion of the natives, without attempting to form any permanent establishments. They visited many of the Indian towns and villages; and following the wandering Guaranis through their forests, and into the recesses of their mountains, disposed many thousands of them to receive the gospel. They managed with astonishing address the most fierce and untractable of the Indian nations, with whom both force and fair measures had previously been found unavailing; and their mediation was often successfully exerted in repressing the cruelty of the Spaniards, and in restraining the desertion of those that formed their encomiendas. But their interference, (for they continued to plead with unshaken constancy the cause of the oppressed Indians,) sometimes exposed them to obloquy, and even ill treatment from the Spaniards, who regarded the natives as their lawful property, which they had acquired by their valour, and which they were determined to maintain against every other authority. The exertions of these men in the cause of religion and humanity, hitherto desultory, were now directed to more determinate objects; the establishment of *reductions* among the natives. In 1609, Father Torrez, the provincial of the Jesuits, received full power from the governor of Paraguay, which was sanctioned by the bishop, to collect their newly converted Indians into townships, which were to be independent of all the other Spanish estab-

lishments; to civilize and to instruct them; and to oppose, in the king's name, all who should endeavour to subject them to personal service. They were only to acknowledge the sovereignty of the king of Spain, of whom they were to be considered as the immediate vassals. This power was afterwards confirmed by Philip III. and his successors; and such were the zeal and labours of the Jesuits, that, in the course of 20 years, they had established 21 reductions upon the Parana and the Uruguay. Their success, however, was suddenly interrupted in 1630, by the devastations of the Paulists, or Mamelukes, (of whom some account has been given in the *History of BRASIL*, vol. iv. p. 422,) who, by their impetuous and reiterated eruptions, almost obliterated the effects of their labours in Paraguay. The Indians, with their native weapons, were unable to resist the fire-arms of their invaders, and the Jesuits were compelled to fly, with their neophytes, from the province of Guayra, and to retire to their missions upon the Uruguay. In these inroads, many of the fathers lost their lives, though in general, the Mamelukes abstained from personal violence to the ministers of religion; and, in two years, 60,000 of the converted Indians are calculated to have been destroyed, or carried off. These disasters the Spaniards beheld with indifference, if not with complacency. They had considered the settlements of the Jesuits as encroachments upon their property; and they even rejected repeated and earnest applications for assistance. They soon, however, felt the effects of their imprudence. The Mamelukes, disappointed by the removal of the missions, advanced with the same hostile spirit towards the encomiendas, devastating their lands, and carrying off the inhabitants; and the cities of Ciudad Real and Villa Rica were razed to the ground. The provincial governments still remained insensible to the situation of the Jesuits, and could be induced, neither by the claims of policy nor humanity, to defend them against their enemies. The only resource, therefore, which remained, was to apply to the Spanish court. A deputation was accordingly dispatched, who plead the cause of their American brethren with such a warmth of colouring and persevering address, that, in 1639, they obtained leave to embody and arm their Indian converts in the European manner. This important privilege soon restored stability and tranquillity to the reductions. The neophytes, trained under the direction of some lay Jesuits, who had formerly been inured to a military life, in their turn became formidable to the Mamelukes, who, in a short time, found it dangerous to appear in the neighbourhood of these settlements. They also rendered very important services to the Spanish governors, who frequently called upon them for assistance on difficult emergencies. On these occasions, however, they were always commanded by the Jesuits, who took particular care to prevent all communication with the Spanish soldiery or inhabitants, and led them back to the reductions as soon as their services could be dispensed with. Their services, however, were not confined to military operations. They were likewise employed in various public works. They rebuilt the city of Santa Fé; erected the fort of Tabati; and, in 1668 and the following years, five hundred of them worked on the fortifications, the fort, and the cathedral of Buenos Ayres. But while engaged in these operations, their wages, their subsistence, and even the expence of their journies, were all defrayed by the Jesuits.

The reductions, already planted, were chiefly compos-

ed of the Guarinis and Tapes, though many of the tribes between the Parana and Brasil had added to their population. Their country was temperate and fertile; and, under the care and direction of their pastors, productions of necessity and of luxury were raised in abundance. Grain, sugar, cotton, tobacco, wax, honey, Paraguay tea, &c. were sources of comfort to the inhabitants, and advantageous articles of traffic to the Jesuits, under whose government they lived in the greatest harmony and regularity. "Here," according to the eulogiums of their advocates, "no person was idle, nor any one overburdened with labour;—all were conveniently lodged and comfortably clothed, and their food was wholesome, abundant, and equally distributed; the aged and infirm, the widows and orphans, were maintained by the community; no monastic institutions, no sordid views of interest, or absurd restraints of pride, fettered the freedom of choice, or defiled the sanctity of marriage; no factitious wants, or destructive luxuries, corrupted the human frame; the benefits of trade were experienced, without the fatal contagion of its vices; neither the practice nor the necessity of capital punishments existed; neither tythes nor taxes were known: and the devouring plague of forensic subtlety, oppression, and delay, was proscribed."

The Spaniards had extended their power over the vast plains which lie between the Paraguay and the Chilian Cordillera. Los Charcas, after an obstinate and vigorous resistance, had submitted to Gonzalez Pizarro, soon after the subjugation of Peru; and Tucuman had also been subdued, and settled by the conquerors of that country. The re-establishment of Buenos Ayres had been resolved upon by the governor of Paraguay, and carried into execution in 1580,—the want of a proper harbour at the mouth of the La Plata rendering that undertaking absolutely necessary. This city was at first exceedingly annoyed by the adjacent Indians, and remained long in a state of poverty. It, however, emerged by degrees into distinction, and rose to be the capital of the viceroyalty. A new province, distinct from that of Paraguay, had also been established about 1620, under the name of Rio de la Plata, now Buenos Ayres, of which Don Diego Gongora was appointed governor.

Except an insurrection of the Indians, held in the encomiendas of Assumption, which was soon quelled by the assistance of the neophytes, in 1660, nothing of importance occurred until 1679, when the Portuguese attempted a settlement on the north bank of the Rio de la Plata. Their intention was no sooner known, than Garro, the governor of Buenos Ayres, dispatched a summons to Lobo, the Portuguese commander, to evacuate the territory of Spain. Lobo replied, that he was upon the territory of his sovereign; and even claimed the whole of the left bank of the Paraguay and La Plata, as belonging to the king of Portugal. During some discussions that followed respecting the limits of the two nations, the settlement, under the name of Colonia, or San Sacramento, had been prosecuted with great industry; a regular fortress had arisen, well mounted with cannon, and provided with military stores, and every thing requisite for the building and defence of a city. But Garro having received orders from the viceroy of Peru to attack the Portuguese, its reduction immediately followed, when the fort was levelled with the ground. This settlement has given occasion to many disputes and struggles between the rival powers of Portugal and Spain, and has been successively wrested from its

founders and restored, until 1778, when it was finally ceded to the Spaniards.

The spirit of dissension still prevailed at Assumption, and a scene of outrage and rebellion arose about the beginning of the last century, which threatened the dependence of Paraguay upon the crown of Spain. There were many chiefs in the province, who, like Irala, were eager for dominion, and only waited for a favourable opportunity to usurp the sovereign authority. Among these was Don Joseph de Antequera, a knight of Alcantara, and a man of family and genius. Intriguing and ambitious, he had fomented discontent among the inhabitants against the existing governor, Don Diego de los Reyes, which rose so high, that Don Diego, fearing an attempt upon his life, fled to Buenos Ayres. Antequera, supported by his friends, assumed the reins of government, and entered upon the exercise of his new dignity without opposition. As soon as this transaction was known at Lima, the viceroy of Peru issued a new commission, dated 16th of February 1722, reinstating Don Diego in his office; and ordered Antequera immediately to quit the province. Antequera, however, had gone too far to recede with safety; and though the order was repeated, he still retained his situation, and even openly avowed his resolution of maintaining himself in the government, in spite of all the dispatches he might receive from Lima. Negotiation was attempted to bring him to his duty, but in vain. He had even sent an armed force to Corrientes, a town within the jurisdiction of the governor of Rio de la Plata, to seize the person of Don Diego, who was carried to Assumption, and thrown into a dungeon. Forcible measures were now resorted to; and Don Balthazar, the king's lieutenant at Buenos Ayres, advanced at the head of the provincial troops, and 2000 of the reduction Indians, to compel the rebels to submission. Antequera, with 3000 men, marched from Assumption to meet him, leaving orders with Juan de Mena, one of his trusty adherents, that, in case of a defeat, Don Diego should be publicly strangled. In the engagement which followed, the royal troops were routed with great slaughter. Antequera entered the city in triumph; dragged the royal standards taken in battle before him on the ground, and displayed his own in the cathedral of Assumption. But more timid and temporizing than became his situation, or was consistent with his past conduct, he, instead of throwing off all subjection to the Spanish government, and assuming at once the sovereign power, still nominally owned the sovereignty of the king of Spain, at the same time that he disobeyed his mandates, and resisted his authority. His usurpation, however, was but of short duration, though his fall was more owing to the defection of his friends, than to the power of his enemies. The Bishop of Paraguay had set himself secretly to counteract the influence which Antequera had acquired over the minds of the inhabitants; and by his conciliating manners and intriguing address, in a short time greatly diminished the number of his adherents. So effectual were his exertions, that when Zabala, the governor of Buenos Ayres, was advancing against Assumption with a powerful army, he even ventured to publish a mandate, excommunicating all those who should oppose his reception into the city. Antequera was so confounded by this proceeding, and still more discouraged by the lukewarmness of many of his friends, that he immediately fled with a few of his adherents, and took refuge in a convent at Cordova; but, being afterwards seized at

La Plata, the capital of Los Charcas, he and Juan de Mena were thrown into prison at Lima. Zabala entered the city on the 24th of April 1725, and, having quickly re-established tranquillity, left Don Martin de Borua in quiet possession of the government. Borua, however, had scarcely commenced his administration, when he was suspected of favouring the views of Antequera, who, even in prison, looked forward to his re-establishment in Paraguay. The viceroy consequently determined upon his removal, and nominated Don Ignatius Soroea to succeed him. But a popular faction, under the name of the Commune, refused to admit the new governor into the city. At the head of this faction was one Mompo, a partizan of Antequera, and who had escaped out of prison at Lima, and had obtained a municipal situation at Assumption. Eloquent and enterprising, he endeavoured, by every mean, to detach the hearts of the inhabitants from the parent state. He openly promulgated the most democratic doctrines, and asserted, that the authority of the people was paramount to that of the king. "Let us oppose," said he, "the reception of Soroea in the name of the commune, and then no one in particular can be called to account for it." But the abdication of Borua leaving the government without a head, the commune found it necessary to elect a *junto*, in whom the sole authority of the province should be immediately vested. Of this council Barreyro, the first *alcalde* of the city, was appointed president. He had hitherto appeared to favour the views of the commune, but it would seem, from his subsequent conduct, that it was with a design of counteracting rather than of aiding their plans; for he began his administration by attempting to restore order and subordination to the province, and, seizing Mompo, sent him a prisoner to Buenos Ayres. The other members of the *junto* immediately took the alarm, and opposed the measures of Barreyro so effectually, that he was compelled to fly from the city, when Michael de Garai was appointed in his stead.

During these proceedings, Antequera and Juan de Mena, after five years confinement, had been tried at Lima, and found guilty of high treason. They were condemned to be beheaded; but such was the general interest excited in favour of Antequera, that the viceroy, in order to prevent his rescue by the populace, ordered him to be shot on his way to the scaffold, on the 5th of July 1731. The news of his death produced a most violent sensation at Assumption. The city was filled with uproar and confusion. He was canonized as a martyr of liberty, and a victim of oppression; and nothing was heard but encomiums upon his conduct, and lamentations for his fate. For four years the commune continued their dissensions, and resisted the Spanish authority: and it was not until the beginning of the year 1735, that order and tranquillity was restored to the distracted inhabitants of Assumption, by the wisdom and active exertions of Zabala, the governor of Buenos Ayres, who is said to have corrected the abuses, and restrained the enormities which had crept into existence since the first revolt of Antequera, with a sedateness and dispatch which caused general astonishment.

The increasing prosperity of the Jesuits now began to attract the attention of the Spanish government. Besides their settlements upon the Parana and the Uruguay, they had established reductions among the Chiquitos and the Moxos; and also several of the Pampas Indians had been united in a reduction called Concepcion, a little south-east of Buenos Ayres. The number

and strength of these establishments rendered them objects of considerable apprehension to the Spanish colonists, who, imagining that they beheld them advancing with a decided step to independent empire, were alarmed at the stability and importance which they had acquired. They were also exasperated at the subduction of so many tribes of Indians, who, they asserted, belonged to them by right of conquest, and ought to have been divided in *encomiendas*. Repeated attempts were consequently made to ruin the Jesuits at the court of Madrid. They were loaded with accusations and aspersions, and were solemnly charged with alienating the Indians from the crown of Spain. But many of these imputations having been found to be either groundless or exaggerated, they were confirmed by a royal decree, in 1745, in all their rights and immunities. The revolt of the Guarinis, however, which soon followed, greatly diminished the power of the Jesuits. By a treaty, entered into at Madrid in 1750, seven of the Guarinis Reductions, situated on the eastern side of the Uruguay, were ceded to Portugal in exchange for the colony of San Sacramento, and a right to the whole of the northern shore of the Rio de la Plata. The Guarinis, who had always borne an invincible hatred to their Brazilian neighbours, were exasperated at this proceeding. They maintained, that, as their submission to Spain was merely voluntary, they could not be disposed of to any other power without their own consent, and immediately flew to arms in defence of their rights. For several years they resisted the united colonial troops of Portugal and Spain; and, rather than submit, determined to abandon their country. They carried off all that they were able; set fire to the remainder, and left nothing but a desert to their enemies. The Jesuits were suspected of having promoted and aided the opposition of the Guarinis; and, though they openly disavowed the charge, they were unable to free themselves from the imputation. They did not, however, long survive this dismemberment of their dominions. The expulsion of their order from Spain, in 1767, was immediately followed by the subversion of their empire in America. Their missions were converted into regular Spanish settlements, called *Presidencies*; and they were succeeded in their spiritual labours by the monks of St Francis, St Dominic, and the order of Mercy. We may form some estimate of the prosperity of these reductions, from the number of cattle which they possessed at the time of their annexation to the government of Paraguay, viz. 769,353 horned cattle, 94,983 horses, and 221,537 sheep.

The difficulties attending the direction of such an extensive viceroyalty as that of Peru, determined the Spanish court to disjoin the provinces of Buenos Ayres, Paraguay, Tucuman, Los Charcas, and Cuyo, from that government, and to erect them into a separate viceroyalty, with Buenos Ayres for its capital. This arrangement was soon found to be most conducive to the prosperity of the country, as well as to the advantage of the parent state; for, except some partial insurrections among the Indians of Los Charcas, and the Guarinis presidencies, nothing of importance occurred to disturb the tranquillity of the colonists until 1806, when a British squadron appeared in the mouth of the Rio de la Plata.

This expedition, under the command of Major-General Beresford and Sir Home Popham, anchored off Point de Quilmes, about twelve miles from Buenos Ayres, on the 25th of June 1806. The debarkation of the troops

was effected in the course of the afternoon and night, without the least opposition from the enemy, who, though stationed at the village of Reduction, only about two miles from the beach, remained quiet spectators of our operations. After a feeble resistance on the following day, they fled with precipitation, leaving behind them four field pieces, and one tumbril; and, taking up a new position on the Rio Chuelo, nearly three miles from the city, attempted to oppose the passage of the British troops. A few discharges of artillery, however, and the determined appearance of our army, soon compelled them to disperse, when General Beresford entered the capital without opposition. The conquest of this important settlement was thus effected with a very trifling loss,* and the captors were rewarded with a rich booty in specie and colonial produce.† Short lived, however, was our triumph; for no sooner did the Spaniards discover the inconsiderable force which had possession of their capital, than they immediately determined upon its recovery, and, before reinforcements should arrive from England, to expel from their country these daring intruders. A thousand regular troops from Monte Video, under the command of Colonel Liniers, supported by an armed mob, amounting to nearly 20,000 men, marched against the city. But the British troops, consisting of only 1300 men, received them with such cool and determined resistance, that they were at first repulsed and thrown into confusion. By repeated attacks, however, they prevailed. The British were at last overpowered, and obliged to surrender, on the 12th of August, with the loss of 114 men killed and wounded. Scarcely was the recapture accomplished, when succours arrived from the Cape of Good Hope; with which Sir Home Popham, after having made an abortive attempt upon Monte Video, took possession of Maldonado, a strong position at the mouth of the La Plata.

The people of England were so delighted with the intelligence of their new conquest, and so buoyed up with the prospect of a free and ready market for their manufactures, that the ministry, in compliance with the public feeling, but contrary to their own better judgment, resolved to retain a possession which had been acquired without either their consent or approbation. Sir Samuel Auchmuty was consequently dispatched with a strong reinforcement; but, before his arrival, Buenos Ayres had been lost. He, however, took Monte Video by storm, and then sent a small detachment under Colonel Pack to occupy Colonia del Sacramento, which lies on the north side of the river, opposite to Buenos Ayres.

The English general waited now only for farther succours to proceed against the Spanish capital. The Spaniards, in the mean time, however, had made every preparation for defence. Their ancient animosity against the English, which had been excited by the ravages of Drake, of Cavendish, and of the Buccaneers, was now revived; and they determined upon a stout and resolute opposition. Every avenue to the city was barricaded with bullocks' hides, placed from fifteen to twenty feet

thick, against which it would be in vain to fire. Many of the houses which had parapet walls were planted with small artillery; and every citizen that could carry arms had his appointed station. Conspiracies were also forming in the very heart of the British troops. The Spanish inhabitants of Monte Video had secreted arms and ammunition in their houses, with the intention of rising upon their conquerors; and a Spanish gentleman and his servant were executed, for endeavouring to entice some of the 9th light dragoons to join the Spanish army.

General Whitelocke arrived at Monte Video on the 10th of May 1807, to take the chief command of the British force; and, on the 15th of June, was joined by General Craufurd, with the expedition which had been destined against Chili, but which the British government, upon receiving intelligence of the recapture of Buenos Ayres, had commanded to repair to the Rio de la Plata. With this united force of 8000 men, consisting of some of the finest troops in the British service, General Whitelocke sailed from Monte Video on the 21st of June, and, having landed on the 28th in the bay of Barragan, proceeded against Buenos Ayres. After a tedious march of above thirty miles, through a country intersected by swamps and deep muddy rivulets, during which the army were exposed to incredible hardships and privations, being obliged to leave their artillery and baggage behind, and to fight with several detachments of the enemy, which endeavoured to oppose their advance, they reached the environs of the city. Here the English commander, having formed his troops into a line, extending along the suburbs, from the convent of Recoleta on the left, to nearly the Residencia on the right, issued his orders concerning the plan of attack, which he proposed should be pursued on the following day. Two six pounders, covered by the carabineers under Lieutenant-Colonel Kingston, and three troops of dragoons, were ordered along the central street; Sir Samuel Auchmuty was directed to penetrate with his brigade the streets on the left, and with the 38th regiment to take possession of the Plaza de Toros and the adjacent strong grounds; and General Craufurd was to proceed down the streets on the right, and with the 42d regiment to take possession of the Residencia. Each column, preceded by two corporals armed with crow's, for the purpose of breaking open the doors of the houses, was ordered to advance until it reached the last square of houses next the river La Plata, of which it was to possess itself, and forming on the flat roofs, there to wait for farther orders. No firing was to be permitted, until the troops had reached their points of destination, and formed; and a cannonade in the centre was to be the signal for the whole to come forward.

According to this arrangement, the army moved forwards on the morning of the 5th of July; but this extraordinary mode of attack was met, on the part of the Spaniards, by a most vigorous and efficacious resistance. Some of the streets were intersected by deep ditches, planted with cannon, which poured showers of grape on the advancing columns; and a heavy and continued fire

* One seaman killed; one serjeant, and seven rank and file wounded; and one officer missing.

† According to the terms granted to the inhabitants of Buenos Ayres by the British commanders, all *bona fide* private property was to remain free and unmolested; but all public property, of every description, was to be delivered up to the captors. Among the former were 158 coasting vessels, with their cargoes, valued at one million and a half of dollars, which were given up to their owners. The specie amounted to 1,291,323 dollars; of which 1,086,208 dollars, was shipped on board the *Narcissus* for England; and the remainder was allowed to remain in the treasury, for the exigencies of the army and navy, and for the purpose of keeping down the exchange on bills drawn on the respective services.

The merchandise found in the king's stores, consisting principally of jesuits' bark and quicksilver, and in the stores of the Philippine Company, was valued at between three and four millions of dollars.

of musketry from the roofs and windows of the houses, assailed the British troops at every step of their progress. The left division, under General Achmuty, by the most spirited and successful gallantry, had gained the Plaza de Toros, and taken 32 pieces of cannon, 600 prisoners, and an immense quantity of ammunition, with the loss, however, of the whole of the 88th regiment, which had been overpowered and taken prisoners. The centre division had scarcely entered the street, when they were arrested by a destructive and superior fire, and took up a position in front of the enemy, a little in advance of what it held in the morning. A small part only of the right division reached the Residencia; the rest, under General Craufurd, having taken refuge in the convent of the Dominicans, after a vigorous and protracted resistance, were at last compelled to surrender at four in the afternoon. What human intrepidity could accomplish, was performed by the British troops in this unequal conflict; but what was most galling to brave men in the midst of danger, they were doomed to suffer, without the possibility of retaliating upon their enemies. Their bayonets could not reach their distant and often unseen opponents, whose destructive fire issued from the windows and roofs of the houses, the doors of which were so strongly barricaded, that it was almost impossible to force them. "The nature of the fire," says the commander of the expedition, in his public dispatches, "to which the troops were exposed, was violent in the extreme; grape-shot at the corners of all the streets, musketry, hand-grenades, bricks and stones from the tops of all the houses; every householder with his negroes defended his dwelling, each of which was in itself a fortress; and it is not perhaps too much to say, that the whole male population of Buenos Ayres was employed in its defence." The disasters of this day, which amounted to the loss of nearly a third of the British army in killed, wounded and prisoners, without having gained any material advantage—and the consideration that these prisoners were in the hands of an exasperated populace, whose animosity to their invaders no power could restrain, if offensive measures were persisted in—induced the English commander to agree to an armistice proposed by General Liniers, on the morning of the 6th. This armistice issued in a convention, by which it was engaged, that the British should evacuate the La Plata in two months; and that all the prisoners on both sides, captured in South America since the commencement of the war, should be restored. The Spaniards were now, for a time, freed from foreign hostility, for which they considered themselves as indebted to the incapacity and presumptuous temerity of the English leader; and those bright prospects of wealth which the British merchants had been led to indulge, from the expectation of a ready market for their manufactures, and which had induced them to enter into the most hazardous speculations, to the amount, it is said, of three millions sterling, were dissipated for ever. So great, indeed, was the antipathy of the Spaniards to the British, that though greatly in want of our merchandize, and knowing that this visit to South America would perhaps be our last, yet they could not be prevailed upon to purchase a single article.

Upon the breaking out of the Spanish revolution, the resentment of the inhabitants of Buenos Ayres was diverted from the English, and fixed upon the ruler of France. The plan of Bonaparte had no sooner been accomplished against the royal family of Spain, than

VOL. IV. PART II.

French agents were dispersed throughout the Spanish American colonies, to obtain from the different governments a recognition of Joseph Bonaparte as their rightful sovereign. One of these had been received by Liniers, who was evidently well inclined towards France, and who waited only for the issue of the contest to acknowledge the strongest; but as he had, at the same time, received instructions from the council of the Indies to proclaim Ferdinand VII., he was obliged to comply; and the ceremony was performed with solemnities and public rejoicings. But notwithstanding the known principles of the governor, the patriotic cause daily acquired strength; and it soon became as unpopular to speak French as it ever had been to speak English. Arrangements were even made with the government of Brazil, for opening Buenos Ayres to British and Portuguese ships. Liniers, however, soon showed himself hostile to these measures of reconciliation. He entrapped and sent to sea some members of the Cabildo, who opposed the recognition of Bonaparte; and prohibited the admission of all British goods into the La Plata. Affairs continued in this disturbed state until the 22d of May 1810, when a complete revolution took place in the government of this settlement. At a meeting of the inhabitants held with the consent of the viceroy, it was resolved to appoint a superior junta, who should exercise the powers of government until the establishment of a general junta for the viceroyalty. This body were bound by oath, faithfully to discharge their functions, punctually to observe the laws of the kingdom, and to maintain the integrity of that part of the dominions of America, in favour of their beloved sovereign, Ferdinand VII. In a proclamation which they issued upon entering into office, they declared their intention of increasing the force of the country; and required, in the first place, that all persons between 18 and 40 years of age, who were without any visible means of livelihood, or were unemployed in the public service, or in any profession, should immediately enrol themselves. "The nations of the old world," said the junta, "never witnessed a spectacle so affecting as that which we have exhibited. When your spirit was supposed to be completely exhausted by the affliction you were plunged into by the melancholy situation of the Peninsula, you, by an heroic effort, resolved to avenge so many misfortunes, and to teach the general oppressor of Europe, that the American character opposes to his ambition a still stronger barrier than the immense ocean, which has hitherto set bounds to his enterprizes."

At the same time, however, that the junta declared their attachment to Ferdinand VII., a general disposition seemed to prevail among the provinces to shake off their dependence upon the mother country, until that monarch should be restored to his throne. They accordingly refused to admit Don Xavier de Elio, who had been appointed by the regency of Spain to take possession of the viceroyalty, leaving the acknowledgment of the regency, and consequently the viceroy's appointment, to the decision of the representative assembly, which was about to be held at Buenos Ayres. But the junta, in their answer to Lord Strangford's offer of mediation between them and the Peninsula, plainly intimate a determination to resist all authority which the government of Cadiz may assume in the direction of their affairs. "The Peninsula," say they, "is no more than a part of the Spanish monarchy, and that so maimed, that it would be no small concession to put it upon

5 I

an equality with America. It therefore follows, from this principle, that the Peninsula cannot hold any authority over America, nor this over that." The government of Monte Video, however, which had at first resolved to adhere to the proceedings of the inhabitants of Buenos Ayres, now received Elio as viceroy, and determined to acknowledge the regency of Spain. Hostilities were, consequently, commenced between the two cities. Buenos Ayres was blockaded by a squadron of English, Spanish, and Portuguese vessels. Frequent skirmishes took place between the troops of the junta and the Monte Videans, in which the former in general had the advantage; and, in a battle fought on the 18th of May 1811, at Las Piedras, Elio's force was completely defeated, when Monte Video was immediately invested by the Buenos Ayres army under General Artigas. Several actions had also been fought by the revolutionists and the troops of Peru; the viceroy of that country having successfully checked, for a time, all attempts at a reformation in the government, and endeavoured to enforce the authority of the regency upon the other provinces. After various successes, the revolutionary army under Castelli (who had been appointed generalissimo by the junta) sustained a complete defeat from the Peruvians under Ygoneche; and it is said that Castelli and General Balcarce continued their flight for 100 leagues, without waiting for any of their followers! This disaster, and the discouragements which the besieging army before Monte Video had experienced from the strength of the place; and the facility with which supplies were obtained from Brazil, together with the bombardment of Buenos Ayres, which had commenced on the 14th of July by the command of Elio, induced the junta to listen to terms of accommodation. Elio had taken advantage of the present unprosperous state of affairs, and had sent two senior officers, who were his prisoners, to propose a negotiation; intimating, at the same time, that he was not averse to the formation of juntas in the colonies, provided that fit boundaries were assigned to their functions, and proper restrictions were applied to their powers. The proposal was assented to by the junta; and the first conference between the viceroy and their accredited agent was to be held on board the Nereus British frigate, then lying in the La Plata, in August 1811. Of the result of this conference, however, no account has been yet received in this country; but by the latest intelligence from this quarter, dated September, we learn, that sanguine hopes were entertained by the inhabitants of both cities, that it would lead to a speedy and amicable accommodation.

Whatever be the fate of this country—whether it shall again acknowledge its subjection to the Spanish monarchy, or erect itself into a separate and independent state, the enlightened proceedings of the provisional junta will ever be remembered with gratitude and admiration by every friend of humanity and freedom, but particularly by the posterity of the present oppressed and degraded sons of America. "We have beheld with regret," says the new government, in their decree of September 1811, "the miserable and debased condition of the race of Indians. Those our brothers, who are certainly the first-born sons of America, were excluded from the blessings and advantages of their native soil, and made the victims of ambition. They were not only buried in the most ignominious slavery, but were condemned to glut the avarice and luxury of their oppressors. A fate so humiliating could not fail to interest the

sensibility of a government, which endeavoured to promote the general happiness of the country, by carrying into effect the same liberal principles to which it owed its formation, and which must produce its continuance and felicity. The government, deeply impressed with these principles, and desirous of adopting all the means calculated to restore the Indians to their primitive rights, have declared them as capable of rising to all the ranks, offices, and posts, which have been the birth-right of Spaniards, as any other class of the inhabitants: and, to destroy the last link of the chain of servitude, have resolved, that henceforth, in all time coming, the tribute which the Indians paid to the crown of Spain shall be abolished in all the districts of the provinces united to the existing government of the river Plata."

We shall now conclude this article with a short account of the government and revenues of this viceroyalty, as they existed before its separation from the parent state.

The government of Buenos Ayres is vested in a viceroy, who represents the person of the Spanish monarch, and who exercises the supreme authority in every department of the state, civil, military, and criminal. He possesses the power, and is surrounded with all the splendour and dignity of a sovereign prince; and though his salary is extremely moderate, not exceeding 40,000 ducats, yet, from the numerous opportunities which he possesses of accumulating wealth, he may raise an annual revenue superior to that of any European subject. It is a common saying among the Spaniards: "The legal revenues of a viceroy are known, but his real profits depend upon his opportunities and his conscience." He is generally nominated only for three years, though he is sometimes enabled to purchase a prolongation of his government, by his influence at the court of Spain. The administration of justice is entrusted to the royal audiences of Buenos Ayres and Los Charcas, who take cognizance of all civil and criminal causes.—Their sentence is final in all lawsuits concerning property, not exceeding 10,000 piastres in value; but if the subject of dispute exceeds that sum, the cause may be carried by appeal before the royal council of the Indies in Spain. Those tribunals have the power of remonstrating against any of the political regulations of the viceroy, which involve in them a question of civil right, and of laying the matter before the king and the council of the Indies. They possess also the more substantial prerogative, of exercising all the functions of viceregal authority, upon the death of a viceroy, until another is appointed by the king. Each province has a governor, who is subject to the commands of the viceroy, and amenable to his jurisdiction; and subordinate to these are magistrates of various orders and denominations.—"Every department of domestic police and finance," says Wilcocke, "is encumbered with a variety of tribunals, and of officers, multiplied with anxious attention, from the jealous spirit with which Spain watches over her American settlements, and from her endeavours to guard against fraud in provinces so remote from inspection." And M. Azara, speaking on the same subject, says, "On érigea tant de tribunaux, et on multiplia tellement les employés de tous côtés, qu'il me serait impossible de les compter."

The ecclesiastical establishment of Buenos Ayres equals in power and splendour that of any kingdom in Europe. The Indians are attracted by the magnificence and pageantry of its rites; and the superstitious liberality of the American Spaniards has adorned their ca-

thedrals and churches with the most profuse magnificence. The tithes, which are exacted with the utmost rigour, are almost entirely devoted to the support of the hierarchy; but while the dignitaries of the church are endowed with splendid incomes, many of the inferior orders are allowed to languish in poverty and dependence. One fourth of the tithes is allotted to the bishop of the diocese; another fourth to the dean and chapter, and other officers of the cathedral; and the remaining half is divided into nine equal parts; two of which are paid to the crown, under the name of *los dos novenos reales*; and the other seven are applied to the maintenance of the parochial clergy, the erection and support of churches, and other pious uses. Numerous monasteries and convents are scattered throughout the whole viceroyalty, which have proved most inimical to the prosperity and population of the country. The superstition and misguided zeal of the European Spaniards are far surpassed by their brethren in America; and even the most remote and desert provinces are filled with these mansions of bigotry and sloth.

The public revenue of this viceroyalty is derived from various sources, of which the following statement is given by Mr Wilcocke in his *History of Buenos Ayres*. He divides it into four capital branches: 1st, What is paid to the king, as superior lord: 2d, The duties on commerce: 3d, What the king receives as head of the church: And, 4th, Profits arising from the monopoly of various branches of trade.

<i>First Branch.</i>	<i>Piastres.</i>
Duties on the gold and silver coined at Potosi,	650,000
Profit on the coinage, - - - - -	120,000
Tribute of the Indians, - - - - -	550,000

<i>Second Branch.</i>	
<i>Alcavala</i> , or excise on the sale of goods, which is 4 per cent. - - - - -	385,000
Minor duties of excise, - - - - -	200,000
Stamp-duty, - - - - -	32,000
<i>Aduana</i> , or customs on imports and exports, including the <i>almajorifazgo</i> , or custom-duty, the <i>averia</i> , or convoy-duty, and the consu-	

* These bulls are published every two years, and contain an absolution from past offences, and a permission to eat several kinds of prohibited food during Lent, and on meagre days. Monks are employed to disperse them, and to extol their virtues; and they are greedily bought up by the credulous and ignorant vulgar, who look upon them as essential to their salvation. The price varies according to the rank of the purchaser. At a late *Predication* for Peru, including Paraguay, there were issued:

<i>Bulls.</i>		<i>Pesos.</i>	<i>Reals.</i>		<i>Pesos.</i>	<i>Reals.</i>
3	at	16	4½	each,	49	5½
14,202	-	3	3	-	47,931	6
78,822	-	1	5½	-	133,012	1
410,325	-	4	-	-	205,162	4
668,601	-	3	-	-	250,725	3
1,171,953					636,887	3½

Or, 143,298*l.* 6*s.* 5¼*d.* sterling.

5 I 2

lado, or town's dues; and amounting to 34½ per-cent. - - - - - 750,000

Third Branch.
Produce of the bulls of Cruzado,* - - - - 160,000
First fruits and ecclesiastical annates, - - - 30,000
Royal ninths of the tithes, - - - - - 72,000

Fourth Branch.
Profits on the trade in quicksilver, tobacco, gunpowder, and paper, - - - - - 350,000
— on the assiento of negroes, - - - - 200,000
— on the trade in the herb of Paraguay, formerly monopolized by the Jesuits, - - 500,000
Other revenues formerly belonging to that order, - - - - - 400,000

Total amount in piastres, 4,399,000

Or, in sterling money, 989,775*l.*: 0: 0.

Of this revenue, however, no part goes to the parent state, the whole being absorbed by the expenses of the interior administration of the viceroyalty; and such are the sums necessary for supporting this splendid establishment, that very little is spared for the purposes of amelioration or of defence. "En effet," says M. Azara, "il est impossible, et au ministre, et a qui que ce soit, de savoir, si cette vice-royauté produit ou non quelque chose au tresor public, parceque, dans toute son etendue, à peine y a-t-il une caisse ou une administration que n'ait fait banqueroute. Un tres grand nombre n'a pas encore rendu ses comptes, et on n'a pas vérifié ceux de plusieurs qui les avaient présentés."

According to Estalla, the population of this vast viceroyalty may be computed at 1,000,000 Spaniards and Creoles, besides Indians: and Mr Humboldt estimates the whole at 1,100,000, but at the same time informs us, that this estimation is not altogether accurate, as he has not been able to procure any satisfactory information on the subject. According to Azara, the province of Paraguay contains 97,500 souls, and the province of Buenos Ayres 170,900. See Azara *Voyages dans l'Amerique Meridionale, depuis 1781, jusqu'en 1801*. Wilcocke's *History of the Viceroyalty of Buenos Ayres*. Humboldt's *Political Essay on the Kingdom of New Spain*. Coletti *Dizionario Storico Geografico dell' America Meridionale*. Helm's *Travels from Buenos Ayres by Potosi to Lima*. (p)

GENERAL EXPLANATION
OF THE
PLATES BELONGING TO VOLUME FOURTH,
OF THE
AMERICAN EDITION
OF THE
NEW EDINBURGH ENCYCLOPÆDIA.

PLATE LXVI.

- Fig. 1. A Seed : The common Bean, (*Vicia Faba*) *a*, the Scar, (*Hilum*.)
- Fig. 2. One of the Cotyledons of the common Bean, separated from the other. *a*, The external membrane, (*tunica externa*); *b d*, the Corcle; *b*, the Plumule; *d*, the Rostel; *c*, the internal Membrane, (*tunica interna*.)
- Fig. 3. A Pappus, (*Pappus*), sessile, with simple rays. Thistle, (*Carduus*.)
- Fig. 4. Another kind of Sessile Pappus, with compound rays; (*Silphium maritimum*.)
- Fig. 5. A Pappus of a hook shape, of the Small Burdock, (*Xanthium strumarium*.)
- Fig. 6. A Pappus composed of simple rays, with a foot-stalk : Dandelion, (*Leontodon Taraxacum*.)
- Fig. 7. A Pappus, with compound rays, and a footstalk, in the Smooth Cat's Ear, (*Hypochaeris glabra*.)
- Fig. 8. The Hair Net, (*Capillitium*), displayed by a highly magnified representation of the *Cribraria vulgaris*.
- Fig. 9. The Winged Seed of the *Thapsia villosa*; it is also ribbed.
- Fig. 10. A sessile Pappus, with rays alternately long and short, (*Cnicus benedictus*.)
- Fig. 11. A Pappus resembling fine hair, (*Andryala*.)
- Fig. 12. The Seed of the Trifid Bur Marygold, (*Bidens tripartita*), with numberless small points.
- Fig. 13. The Seed of one of the Genus *Apocinum*, surmounted with silky fibres.
- Fig. 14. A Seed of the Traveller's Joy, (*Clematis vitalba*), terminated by a long fibre, which is thinly covered with small silky points.
- Fig. 15. A Tail (*cauda*) of the Seed of the Traveller's Joy, (*Clematis vitalba*.)
- Fig. 16. A Tuft (*coma*) attached to the pericarp.
- Fig. 17. Another kind of Tuft.
- Fig. 18. The Root, (*Radix*). *AA*, the Rhizoma, (*Rhizoma*), or woody portion of a biennial or perennial tree; *BB*, the Radicles, (*radicula*), and the absorbent vessels of the root; *CC*, the Fibrillæ, (*fibrillæ*.)
- Fig. 19. Bitten Root, (*radix præmorsa*), Devil's Bite, Scabiosa.
- Fig. 20. A Bulb (*bulbus*) transversely cut.
- Fig. 21. A tuberous Root, (*tuber*.)
- Fig. 22. A solid Bulb; that of the hyacinth, (*Scilla nutans*.)
- Fig. 23. Pendulous Root, (*radix pendula*), of the Common Dropwort, (*spiræa filipendula*.)
- Fig. 24. Another example of a Bulb.
- Fig. 25. Testiculated Root, (*testiculata*), as in the *Orchides*.
- Fig. 26. Scaly Root, (*squamosa*), Bird's Nest Ophrys, (*Ophrys Nidus Avis*.)
- Fig. 27. Imbricated Root, (*imbricata*), common lily; *Lilium candidum*.
- Fig. 28. Horizontal Root, (*horizontalis*), in most of the genus *Iris*.
- Fig. 29. A spindle-shaped Root. (*fusiformis*), the common carrot, (*Daucus carota*.)
- Fig. 30. An articulated Root, (*articulata*), Common Solomon's Seal, *Convallaria multiflora*.
- Fig. 31. Bending Root, (*flexuosa*), Common Bistort, (*Polygonum Bistorta*.)
- Fig. 32. A capillary Root, (*capillaris*), Common Flax, (*Linum usitatissimum*.)
- Fig. 33. Fasciculated Root, (*fasciculata*), in the *Aspergula*.
- Fig. 34. A palmated Root, (*palmata*), in a species of the *Orchis*.

- Fig. 35. A branching Root, (*ramosa*), in the apple-tree, (*Pyrus malus*), or pear-tree, (*Pyrus communis*.)
- Fig. 36. A variety of a branching Root, as in the Shrubby Cinquefoil, (*Potentilla fruticosa*.)
- Fig. 37. A knotty Root, (*nodosa*), *Rosca*.
- Fig. 38. A creeping Root, (*repens*), common strawberry, (*Fragaria vesca*.)
- Fig. 39. } Herbaceous Stems, properly so called.
- Fig. 40. }
- Fig. 41. The herbaceous Stem of the Dandelion, *Leontodon Taraxacum*. The stem in this instance is also the flowerstalk. It is divested of leaves and branches, and terminates in a bunch of flowers.

PLATE LXVII.

- Fig. 1. The Ear, (*spicula*; *locusta*), and the Straw, (*culmus*), or Barley, (*Hordeum*), with the sheath.
- Fig. 2. The Stipe (*stipes*) of the common Mushroom, (*Agaricus campestris*), and its Cap, (*Pileus*), with an oblique section of the former.
- Fig. 3. A radical Flowerstalk (*Pedunculus*) of the Cowslip, (*Primula veris*.) This flowerstalk might be considered a scape.
- Fig. 4. Another example of the Stipe, terminating in many leaves, the footstalks of which compose the Stipe itself. An oblique section of this Stipe is placed by it, to exhibit its internal structure.
- Fig. 5. A simple, Terminal Flowerstalk, &c.
- Fig. 6. Auxiliary Flowerstalks, (*Pedunculi axillares*); the Wild Cucumber, (*Cucumis*.)
- Fig. 7. Pedicles, (*Pedicelli*) or particular flowerstalks, springing from one common stalk, (*Ammi commune*.)
- Fig. 8. Sessile Flowers, (*Flos sessilis*), without a flowerstalk.
- Fig. 9. A Branch of the Horse Chesnut Tree, *Æsculus Hippocastanus*, exhibiting the different forms of its Buds, in their different stages.
- Fig. 10. A Petiolated Leaf, (*Folium petiolatum*.)
- Fig. 11. The bursting Buds of the Pear-Tree, (*Pyrus malus*), with their accompanying stipules.
- Fig. 12. The opening buds of the Common Lilac.
- Fig. 13. Sessile Leaves, (*Folia sessilia*.)
- Fig. 14. The Bristle of the Common Hair Moss, (*Comune Polytrichum*), with the male flower.
- Fig. 15. The same Plant, with its *Theca*, covered by a hairy *Calyptra*.
- Fig. 16. The *Bryum androgynum*, with its *Theca*, and long terminal *Setæ*; the *Operculum* and *Calyptra*.
- Fig. 17. The Veined Leaf of the *Erythroxylon coca*.
- Fig. 18. The *Scapus* of the Corn Horse Tail, (*Equisetum arvense*.)
- Fig. 19. Pinnatifid Leaves, (*Folia pinnatifida*), *Echinops*.
- Fig. 20. Pinnate Leaves, (*Folia pinnata*), Beech, (*Fagus sylvatica*.)
- Fig. 21. Another variety of the Pinnate Leaf.
- Fig. 22. Pinnate with tendrils, as in the common Pea, (*Vicia sativa*.)
- Fig. 23. Abruptly and equally Pinnate.
- Fig. 24. Articulated Leaves, (*Folia articulata*.) The different species of the genus *Cactus*.
- Fig. 25. Bipinnate and Alternate Leaves, (*Bipinnata* and *Alternata*), Sensitive plant, (*Mimosa sensitiva*.)

- Fig. 26. The chief Footstalk bifurcating, common Black Hellebore, (*Helleborus niger*.)
- Fig. 27. Pinnated irregularly, Agrimony, (*Agrimonia*.)
- Fig. 28. Ternate Leaves, (*Ternata*), Trefoil, (*Trefoilium*.)
- Fig. 29. Conjugate Leaves, (*Conjugata*.)
- Fig. 30. Simple Leaf (*Folium simplex*), being supported by an appropriate foot-stalk.
- Fig. 31. Simple Leaf, (*Simplex*.)
- Fig. 32. Another example of a Simple Leaf.
- Fig. 33. A Skeleton Leaf, exhibiting the internal structure of the Leaf when divested of the green pulpy parts. *Poplar*, (*Populus*.)
- Fig. 34. A Simple Leaf deprived of its Cuticle, by which the internal structure is apparent to the naked eye.
- Fig. 35. An example of a Developing Bud, similar to those, Fig. 11. and 12. of this Plate.
- Fig. 36. Pinnate Leaves, with Axillary Flowers.—Common Bugle, (*Echium vulgare*.)

PLATE LXVIII.

- Fig. 1. A Thyse (*Thyrus*), or Flower-stalk, which springs from the stem, and forms an axis, around which other flower-stalks arrange themselves in different situations, and at different heights, as in Lilac, (*Jasminum*.)
- Fig. 2. Whirl (*Verticillus*), in which the Foot-stalks, the Flowers, or the Fruit, have a circular arrangement.
- Fig. 3. Panicle, (*Panícula*.) The arrangement of the Flower-stalks nearly resembles that of the Thyse, differing, however, in having longer, and more irregular ramifications: this is sufficiently shewn in this Figure.
- Fig. 4. The Frond (*Frons*) of the Palm Tree, and those plants resembling Palms, particularly the Banana, (*Musa*.)
- Fig. 5. Grape like Stem, as in the Common Currant, (*Ribes rubrum*.)
- Fig. 6. Tendril, (*Cirrhus*), which springs from the Bark, as in the *Bignonia*.
- Fig. 7. An Axillary Tendril, (*Cirrhus Axillaris*), the Common Vine.
- Fig. 8. Simple Thorns, and others that are bifurcated.
- Fig. 9. Thorns adhering to the true Wood, after the bark has been separated by means of boiling, in the Sloe, (*Prunus spinosa*.)
- Fig. 10. Another example of a Tendril opposed to a Foot-stalk.
- Fig. 11. A Spine, easily separable from the Wood; but pretty firmly attached to the Bark.
- Fig. 12. An Axillary Tendril. In the Grenadilla, (*Passiflora*.)
- Fig. 13. Scattered Leaves, (*Folia Sparsa*.) In the Lily, (*Lilium*.)
- Fig. 14. Conjoint Leaves, (*Conjuncta*.) Common Honey-suckle, (*Lonicera periclymenum*.)
- Fig. 15. Embracing and Perfoliate Leaves, (*Perfoliata*.) In the Genus *Bupleurum*.
- Fig. 16. Leaves that partially surround the Stem.
- Fig. 17. A Leaf that forms a sheathe for the Stem.
- Fig. 18. Fasciculated or Bundled Leaves *Melissa*.
- Fig. 19. Decurrent Leaves (*Decurrentia*) in the different species of the Thistle. *Carduus*.
- Fig. 20. Leaves in a Whirl, (*Verticillata*.)
- Fig. 21. Stipules (*Stipulae*), scattered and opposit.

- Fig. 22. An Imbricated Leaf, (*Imbricatum*.)
 Fig. 23. A Linear Lanceolate Leaf, (*Lineare et Lanceolatum*.)
 Fig. 24. An Oval Pointed Leaf, (*Ovale*.)
 Fig. 25. An Elliptical Leaf, (*Ellipticum*.)
 Fig. 26. An Oboval Leaf, (*Obovale*.)
 Fig. 27. An Obcordate Leaf, (*Obcordatum*.)
 Fig. 28. A Reniform Leaf, (*Reniforme*.)
 Fig. 29. A Saggitiform Leaf, sinuated at its base, (*Saggitiforme*.)
 Fig. 30. A Triangular Leaf, (*Triangulare*.)
 Fig. 31. Another, but not sinuated, Saggitiform Leaf, (*Saggitiforme*.)
 Fig. 32. A portion of the Sensitive Plant, (*Mimosa Pudica*.)
 Fig. 33. A Cruciform Leaf, (*Cruciforme*.)
 Fig. 34. A Panduriform Leaf, (*Panduriforme*.)
 Fig. 35. A Denticulated Cordate Leaf, (*Denticulatum Cordatum*.)
 Fig. 36. An Oval Leaf, cleft at its apex.
 Fig. 37. A Pointed Oval Leaf, similar to Fig. 24.
 Fig. 38. A Rounded Oval Leaf, doubly serrated.
 Fig. 39. An Elliptical Crenelated Leaf.
 Fig. 40. An Adze-shaped Leaf, oval and pointed.
 Fig. 41. A Notched Leaf, (*Sinuatum*.)
 Fig. 42. A three-cleft Leaf, sinuated, (*Trifidum*.)
 Fig. 43. A Lanceolate Leaf, somewhat serrated, (*Lanceolatum Serratum*.)
 Fig. 44. A Rhomboidal Leaf, (*Rhomboidale*.)
 Fig. 45. A Cylindrical Leaf, (*Cylindricum*.)
 Fig. 46. A Hastate Leaf, (*Hastatum*.)
- Fig. 22. A common proper Calyx.
 Fig. 23. Another example of the same.
 Fig. 24. The chief organs of the fructification of the Woodbind, viz. the Pistil and Stamens, with all their parts.
 Fig. 25. The Capsule transversely cut, to exhibit the structure of the three Cells, each containing a Seed.
 Fig. 26. Another example of a common Calyx, with a tubiform Monopetalous Corolla.
 Fig. 27. A complete Flower, composed of a Monopetalous Corolla, a Calyx, and the Stamens and Pistils.
 Fig. 28. A Polypetalous Corolla, common Pink, (*Dianthus*.)
 Fig. 29. A branch of the Enchanter's Night Shade, (*Circæa lutetiana*), bearing Dipetalous Flowers. A single Flower is immediately below, in which the characters are more distinctly marked.
 Fig. 30. An irregular Calyx, such as most commonly occurs in Labiate Flowers.
 Fig. 31. The *Theca* of Mosses: in one of the Figures it is in its proper situation, in the other it is partially separated.
 Fig. 32. The Catkin (*Amentum*), so called from a supposed resemblance to the tail of a cat.—This is the common Hazle, (*Corylus avellana*.)
 Fig. 33. An imbricated Calyx in the Thistle or Artichoke, (*Carduus*.)
 Fig. 34. The Sheath (*Spatha*) which envelopes the Narcissus, and bursts in consequence of the efforts of the Flower to unfold.
 Fig. 35. The Sheath enveloping the Cuckoo's Pint, (*Arum maculatum*.)
 Fig. 36. A Calyx adhering to the Germen or Seed Vessel. In the natural order, *Cucurbitaceæ*.
 Fig. 37. A double Calyx in the Mallow tribe.
 Fig. 38. A Polypetalous Flower, the Rose, (*Rosa*.)
 Fig. 39. The Glumes of Common Oats, (*Avena sativa*.)
 Fig. 40. A Compound Flosculous Flower.
 Fig. 41. A Tripetalous Flower, *Rosa Tradescantia*.
 Fig. 42. A Petal belonging to Fig. 49, with a Monopetalous Corolla, though commonly considered Polypetalous.
 Fig. 43. A Tetrapetalous Corolla.
 Fig. 44. The Wrapper (*Volva*) of the *Clathrus*.
 Fig. 45. A Radiated Flower.
 Fig. 46. An example of six Stamens surrounding one Pistil in the Lily.
 Fig. 47. A Petal, with the Hectary at its base.—The Crown Imperial, (*Fritillaria*.)
 Fig. 48. A Semiflosculous Flower.
 Fig. 49. A Branch of Common Mallow, bearing Monopetalous Corollas, which may be taken for Polypetalous.
 Fig. 50. A complete Flower, displaying the parts of the Stamens and of the Pistil.

PLATE LXIX.

- Fig. 1. A Lyrate Leaf, (*Lyratum*.)
 Fig. 2. A Three-lobed Leaf, (*Trilobatum*.)
 Fig. 3. A Four-lobed Leaf, (*Quadrilobatum*.)
 Fig. 4. A Compound Leaf, (*Compositum*.) Black Hellebore, (*Helleborus niger*.)
 Fig. 5. A Five-lobed or Palmated Leaf, (*5-lobatum*.)
 Fig. 6. A Palmated Leaf, sinuated at the apices of the Leaves, (*Palmatum*.)
 Fig. 7. A Runcinate Leaf, (*Runcinatum*.)
 Fig. 8. A folded Leaf, composed of seven Lobes, deeply sinuated and serrated, (*Plicatum*, &c.)
 Fig. 9. A Hastate Leaf. Same with Fig. 46.
 Fig. 10. A Pinnatifid Leaf, (*Pinnatifidum*.)
 Fig. 11. An Oblong Leaf, with two sharp appendages.
 Fig. 12. Tergeminate Leaf, (*Tergeminatum*), *Sensitive tergemina*.
 Fig. 13. Biterminate Leaves, (*Biterminatum*), Barren wort, (*Epimedium*.)
 Fig. 14. Triterminate Leaves, (*Triterminatum*), *Paullinia triterma*.
 Fig. 15. A sinuated Rhomboidal Leaf, (*Rhomboidale sinuatum*.)
 Fig. 16. Tripinnate Leaves, (*Tripinnata*), *Aralia spinosa*.
 Fig. 17. Leaves irregularly disposed.
 Fig. 18. A Monopetalous Corolla, (*Corolla monopetala*.)
 Fig. 19. The Calyx of the Flower of the Apricot.
 Fig. 20. The Fruit of the Woodbind, (*Convulvulus*), after the pistil has been obliterated, in consequence of its functions having ceased.
 Fig. 21. A Nut (*Glans*), the exterior covering of which is hard, and within an oily farina is contained.
- Fig. 1. A View of the arrangement of the parts of fructification.
 Fig. 2. A Stamen, with a rounded Anther, emarginated and excavated at the Apex.
 Fig. 3. A Cordate Anther.

PLATE LXX.

EXPLANATION OF PLATES.

- Fig. 4. A Globular Anther, as in the Stamens of the Lime Tree, (*Tilia Europæa*.)
- Fig. 5. An Anther, intimately connected with the thread of the Stamen in the Tulip Tree.
- Fig. 6. An Anther, with Globular Cells, united at their basis to the extremity of the thread.—In the Silver Weed, (*Potentilla anserina*.)
- Fig. 7. A Reniform Anther.
- Fig. 8. A Round Anther, marked with Furrows.
- Fig. 9. A Linear Anther in Magnolia.
- Fig. 10. A Bifid Anther. In most of the Gramina.
- Fig. 11. A Pendant Anther.
- Fig. 12. A Cornuted Anther.
- Fig. 13. A Saggiiform Anther.
- Fig. 14. A Sessile Anther in Common Birthwort, (*Aristolochia clematitis*.)
- Fig. 15. A Cordate Anther, attached by its inferior surface to the thread, which is much dilated at its base.
- Fig. 16. A Prismatic Anther, having four Furrows.
- Fig. 17. An Anther, having two *Cornua* at its apex, and bifid at its base.
- Fig. 18. An Oblong Furrowed Anther. It is represented in this Plate at the moment at which it discharges its Pollen.
- Fig. 19. An irregularly formed Anther, not very common. It occurs in the Genus *Bryonia*, and some others.
- Fig. 20. An Anther, cleft both at the apex and base.
- Fig. 21. An Anther, having a lateral attachment to the Stamen.
- Fig. 22. Each of the Stamens in this Figure bearing at its extremity another transverse thread, terminated at both ends by an Anther of one Cell.*
- Fig. 23. Represents the Stigma and Seed Vessel of the Wood Melic Grass, (*Melica uniflora*.)
- Fig. 24. The Stigma and Seed Vessel of the Pistil of a species of Palm.
- Fig. 25. Those of the *Convallaria*.
- Fig. 26. Those of the *Narcissus*.
- Fig. 27. Of the *Stratiotes*.
- Fig. 28. Of the *Thesium*.
- Fig. 29. Those of the *Atraphaxis*.
- Fig. 30. Those of the *Corispermum*.
- Fig. 31. Those of the *Lythrum*.
- Fig. 32. Those of the *Statice*.
- Fig. 33. Those of the *Dodecatheon*.
- Fig. 34. Those of the *Lathræa*.
- Fig. 35. Those of the *Justicia*.
- Fig. 36. Those of the *Jasminum*.
- Fig. 37. Those of the Olive.
- Fig. 38. Those of the *Melitis*.
- Fig. 39. Those of the *Dodortia*.
- Fig. 40. Those of the *Cerinthium*.
- Fig. 41. Those of the *Convolvulus*.
- Fig. 42. Those of the *Nymphaea*.
- Fig. 43. Those of the *Asclepias*.
- Fig. 44. Those of the *Clathra*.
- Fig. 45. Those of the *Aralia*.
- Fig. 46. Those of the *Menispermium*.
- Fig. 47. Those of the Barberry, (*Berberis vulgaris*.)
- Fig. 48. Those of the *Argemone*.
- Fig. 49. Those of any Flosculous Flower.
- Fig. 50. Those of the *Hypericum androseumum*.
- Fig. 51. Those of the *Citrum Aurantium*.
- Fig. 52. Those of the *Canella*.
- Fig. 53. Those of the *Cucubalis*.
- Fig. 54. Those of the Pink, (*Dianthus*.)
- Fig. 55. Those of the Poppy, (*Papaver*.)
- Fig. 56. Those of Leguminous Flowers.
- Fig. 57. Those of the *Iris*.
- Fig. 58. Those of the Common Vine, (*Vitis vinifera*.)
- Fig. 59. Those of the *Geranium*.
- Fig. 60. Those of the Malvaceous Plants.
- Fig. 61. Several Small Nuts; each is monolocular, and contains Farina, which is also delineated.
- Fig. 62. Another kind of Nut.
- Fig. 63. An Ear of Wheat.
- Fig. 64. An Ear of Indian Corn.
- Fig. 65. The Situation of the Seeds of the *Lavendula Spica*, resting on the *Placenta*.
- Fig. 66. A Pericarp of Flax, and containing several cavities or cells, in which the seeds rest.
- Fig. 67. A Pericarp, equally formed and arranged around a common axis.
- Fig. 68. A Bilocular Capsule, containing the seeds of Dog's Mercury, (*Mercurialis perennes*.)
- Fig. 69. The Capsule of the Castor Oil Nut, *Ricinus Communis*, with the three Cells, exhibited by a transverse section.
- Fig. 70. The Capsule of the *Tetragastris ossea*.
- Fig. 71. The Capsule of the *Hermannia alnifolia*.
- Fig. 72. The Capsule of the *Calla Æthiopica*; the cells, and a single seed, being delineated.
- Fig. 73. The Closed Follicles of the *Asclepias niger*.
- Fig. 74. A Pod of the Pea, shewing the alternate arrangement of the seeds.
- Fig. 75. An Open Pod of the *Astragalus*, which is bilocular.
- Fig. 76. Another Pod, in the cells of which the arrangement of the seeds is also displayed.
- Fig. 77. An Articulated Pod of the *Hedysarum*.
- Fig. 78. The Winged Pericarp of the *Silene noctiflora*; in one figure, the wings closely embrace the front, and in the other they are partially detached.
- Fig. 79. A Pod to which the Seeds are attached by the Umbilical Cord, without any Cells.
- Fig. 80. A section of an Apple, exhibiting the fleshy substance surrounding the cells that contain the seeds.
- Fig. 81. A Drupe of the Walnut, in all its states. 1. Enveloped with its exterior coat. 2. Cut into two parts, and stripped of the bark. 3. The cartilaginous substance contained in the centre of the drupe.
- Fig. 82. Two Drupes of the Cherry tree.
- Fig. 83. A Section of a Peach (also a Drupe). The various parts of the fruit here delineated.
- Fig. 84. The Woody Drupe of the *Cocos nucifera*.
- Fig. 85. An Olive (Drupe), with all its parts.
- Fig. 86. A Berry of the Grape.
- Fig. 87. A Berry of a Rough Gooseberry.
- Fig. 88. A Cone of the Pine, with seeds separated.
- Fig. 89. The Pericarp of the Horse Chesnut.
- Fig. 90. The Pericarp of the Pink, (*Dianthus*.) which has no cells.

* Besides these stamens that have been delineated, there are many others which our limits do not permit us to discuss; but the examination would be interesting, as it might establish a generic character, hitherto little attended to by botanists. Girardin mentions some others, which it may be worth while to examine.

- Fig. 91. The Pericarp of the Violet, (*Viola odorata*.)
 Fig. 92. The Pericarp of the Woodbind, (*Convolvulus*.)
 Fig. 93. Another Species of Pericarp.
 Fig. 94. The Cells opposite to the Valves. In the Tulip.
 Fig. 95. The Pericarp of the *Elatarium momordica* bursting, and throwing its contents out by its elasticity to the distance of a yard.
 Fig. 96. The Pericarp of the Geranium, upon the base of which the fruit rests; in the second figure, the individual seeds are seen attached by a kind of footstalk, in its proper place.
 Fig. 97. The Cells Transverse in the *Polygala*.
 Fig. 98. A Pericarp that bursts in the Middle.
 Fig. 99. A Pericarp that bursts at its Apex.
 Fig. 100. An example of Seminiferous Cells.
 Fig. 101. The Placenta in the Poppy.
 Fig. 102. The Pericarp of the *Silene noctiflora*, which bursts at its Apex, and exhibits the appearance of five teeth.
 Fig. 103. The Placenta of this Plant exhibited.
 Fig. 104. A Laciniated *Arillus* of the Nutmeg.
 Fig. 105. A Five-celled Pericarp transversely cut in the Wood sorrel. *Oxalis acetosella*.
 Fig. 106. A Quadrilocular Pericarp.

PLATE LXXI.

- Fig. 1. The Common Bean (*Vicia Faba*), after the process of germination has begun. *a*, Indicates the Plumule. *b*, The Radicle. *c*, The Ruptured Membrane.
 Fig. 2. Cellular Substance, of regular structure, containing very few pores. *a*, Exhibits, by a transverse section, the Hexagonal form. *b*, A vertical section of the same. *c*, Shews that the sides of the cells are common to those that are adjacent.
 Fig. 3. The Cellular Substance, with elongated hexagons, and more porous membranes.
 Fig. 4. A Lengthened Hexagon, pierced by pores in regular order.
 Fig. 5. Another example of Cellular Substance, containing fissures as well as pores.
 Fig. 6. An example of Simple Tubes. (See Part II. Sect. 2.)
 Fig. 7. Simple Tubes very Porous.
 Fig. 8. Large Tubes.
 Fig. 9. Large Tubes, with Pores.
 Fig. 10. False Tracheæ, with Transverse Clefts.
 Fig. 11. True Spiral Air-vessels of different sizes.
 Fig. 12. Large Tubes, containing both Fissures and Pores.
 Fig. 13. Large Tubes, with a Cleft, a Porous, and a Plain Surface.
 Fig. 14. Large Tubes, with some of the spiral turns untwisted.
 Fig. 15. A Cylindrical and interrupted Rent. *a*, A Transverse Section.
 Fig. 16. An Hexahedral Rent, intersected by Membranes. *a*, Indicates a Transverse Section.
 Fig. 17. The whole of the above parts united.
 Fig. 18. The Cuticle Imperforate.
 Fig. 19. The Cuticle containing Elongated Pores.
 Fig. 20. Cuticle conjoined with Tubular Structure.
 Fig. 21. Cuticle formed by a portion of the Cellular Substance.

VOL. IV. PART II.

- Fig. 22. Cuticle with large and small Pores.
 Fig. 23. Cuticle with apparently obstructed Pores.
 Fig. 24. A Velvety Cuticle, the elevated points of which are merely an external elongation of surface of the cellular membranes, or, as Mirbel expresses it, a kind of protrusion formed by that substance.
 Fig. 25. Another example of Cuticle taken from the *Urtica Arborea*.

N. B. In this Table, the phraseology of Mirbel is retained, as best fitted to describe his own views. For the particular details of these, see VEGETABLE PHYSIOLOGY, Part II. Sect. 2. in which they are fully stated.

PLATE LXXII.

- Fig. 1. *Blitum Capitatum*, illustrative of the class Monandria. It also is an example of an apetalous flower.
 Fig. 2. A beautiful specimen of the *Trientalis Europæus*, illustrative of the class Heptandria.
 Fig. 3. The Flowering Rush, *Butomus umbellatus*, illustrative of class Enneandria. The leaves and germen are separately engraved.
 Fig. 4. Pendulous Lily, *Lilium Penduliflorum*, illustrating the class Hexandria.
 Fig. 5. *Erica conspicua*, illustrative of class Octandria.
 Fig. 6. *Campanula trachelium*, illustrative of class Pentandria.

PLATE LXXIII.

- Fig. 1. A beautiful specimen of the *Dianthus arboreus*, illustrating Decandria.
 Fig. 2. The *Rosa gallica versicolor*, illustrating Icosandria.
 Fig. 3. The *Galeopsis galeobdolon*, illustrating Didynamia, No. 1.
 Fig. 4. The *Antirrhinum majus*. Yellow toad-flax, illustrating Didynamia, No. 2.
 Fig. 5. *Argemone Mexicana*, illustrating Polyandria.
 Fig. 6. *Thlaspi arvense*, or Penny Cress, illustrating Tetradynamia.

PLATE LXXIV.

- Fig. 1. *Hesperis maritima*, illustrating Tetradynamia.
 Fig. 2. *Betula lenta*, illustrating Monœcia.
 Fig. 3. *Scorzonera aspera*, illustrating Syngenesia.
 Fig. 4. *Hypericum*, St John's Wort, illustrating Polyadelphia.
 Fig. 5. Two plants of the *Valeriana spiralis*. That with the short flower stalks is the male, the other the female. These illustrate Diœcia.
 Fig. 6. *Arum maculatum*, or Cuckoo's pint, illustrating Gynandria. Although this plant has been referred in the arrangement to the Class Monœcia, yet we have selected it as sufficiently characteristic of this Class, in which it was originally placed by Linnæus himself.

PLATE LXXV.

- Fig. 1. Filices.
 Fig. 2. Musci.
 Fig. 3. Hepaticæ.
 Fig. 4. Algæ.
 Fig. 5. Fungi
- } Figures illustrative of the orders of the class Cryptogamia.

5 K

PLATE LXXVI.

- Fig. 1. Contains a Section of Mr Bramah's Press for Printing the Numbers and Dates of Bank Notes.
Fig. 2. Is a Perspective View of the same Machine.

PLATE LXXVII.

Represents the Interior of a complete Brewery. The dimensions of the vessels are taken from the newly erected Brewery of Messrs Brown, Parry and Company, in Golden Lane, London, but they are arranged in a different manner.

- Fig. 1. Is the Plan of the Brewery.
Fig. 2. and 3. Are different Elevations of the Establishment.

PLATE LXXVIII.

- Fig. 1. Represents a Plan of the Mash Tun, as constructed by Mr Cooper.
Fig. 2. Is an Elevation of the Mash Tun, part of which is represented in Section, to shew the Machine within it.
Fig. 3, 4, 5. Represent the Vertical Axis and Wheel Work, for giving motion to the Mashing Engine.
Fig. 6. Represents a Stop Valve, which is a simple and effectual substitute for a Cock in many situations of a Brewery.
Fig. 7. Is an Apparatus in Mr Goodwynne's Brewery, for Washing Casks.
Fig. 8. Represents the Vent Peg invented by Mr Bramah, for admitting the proper quantity of Air into a Cask, to allow the Liquor to run off.
Fig. 9. Shews a part of the Apparatus of the Mashing Engine.

PLATE LXXIX.

- Fig. 1, 2, 3, 4. Are different Sections to explain the Structure of a Close Copper, which contains three hundred Barrels.
Fig. 5, 6. Contain a Plan and Section of the Lid of the Copper.
Fig. 7. Represents a Simple Sluice Cock, which is generally used in Breweries.
Fig. 8, 9. Are Stop Cocks, as constructed by Mr Thomas Rowntree, for the Suction Pipes of Pumps.
Fig. 10, 11, 12. Are very ingenious Stop Cocks, invented by Mr Bramah.
Fig. 13. Is a Tasting Cock, invented by Mr Bramah, for the purpose of tasting the Beer at various periods, in the Great Store Vat.

PLATE LXXX.

- Fig. 1. Shews the probable steps by which the Arch was invented.
Fig. 2—10. Are Diagrams for illustrating the theory of Arches.

PLATE LXXXI.

- Fig. 1—10. Are Diagrams for illustrating the theory of Arches, Piers, Abutments, and Sterlings.

PLATE LXXXII.

Contains Engravings of the four most celebrated Bridges at Rome.

PLATE LXXXIII.

Contains a Plan and Elevation of London Bridge;—an Elevation of one half of the Pont de la Guillotiere, over the river Rosne at Lyons;—and an Elevation of one half of the Pont du St Esprit, over the river Rosne at Languedoc.

PLATE LXXXIV.

Contains Plans and Elevations of one half of Orleans Bridge, and one half of Neuilly Bridge.

PLATE LXXXV.

Contains an Elevation of the Bridge of Maxence in France,—a Plan of the Superstructure and Foundation, and a Transverse Section.

PLATE LXXXVI.

Contains a Plan and Elevation of one half of Westminster Bridge, and a Plan and Elevation of one half of Blackfriars Bridge.

PLATE LXXXVII.

Contains Plans, Elevations, and Sections of Tongue-land Bridge over the River Dee, in Scotland.

PLATE LXXXVIII.

Contains a View of the Wooden Bridge built over the Don, in Aberdeenshire, by Mr Burn; and also several Designs for Wooden Bridges, by Palladio.

PLATE LXXXIX.

Contains an Elevation of the famous Wooden Bridge built over the Rhine at Schaffhausen in Switzerland, with Views of some of its parts separately.

PLATE XC.

Contains a Plan of the Roof of the Bridge at Schaffhausen: a Section of the whole Bridge; and a Plan of the Floor.

PLATE XCI.

Contains a View and Sections of the First Iron Bridge built over the River Severn at Coalbrookdale; and also a View and Sections of the Iron Bridge built over the River Wear at Sunderland.

PLATE XCII.

Contains an Elevation, &c. of the Iron Bridge built over the Severn at Buildwas.

PLATE XCIII.

- Fig. 1. Shews the component parts of the Arch in the Iron Bridge at Sunderland, over the River Wear. A, is a side view of a Block; B, an end view; C, one of the wrought Iron Bars, by which the Blocks are united; D, one of the Screw Bolts; E, a length view of one of the Tubes, which unites the Ribs horizontally; F, the end view of the Tube; G, four of the blocks when united, and forming part of two Ribs.
Fig. 2. Is an Elevation of one of the Frames for supporting the Centre.
Fig. 3. Is a Section of the Bridge, 20 feet from the Northern Abutment, in Perspective.

PLATE XCIV.

Contains Elevations of the Iron Bridges at Boston in Lincolnshire, and at Bristol; and an Elevation of Bonar Bridge in Scotland.

PLATE XCV.

Contains a Representation of the Cofferdam employed in laying the foundations of Neuilly Bridge.

PLATE XCVI.

Fig. 1, 2, 3. Contains a view of the Cofferdam used in building the Bridge over the Severn at Bewdley.
Fig. 4, 5. Represent the Plan and Section of a Cofferdam used in under-building one of the Piers, and also the Eastern Abutment of Pulteney Bridge at Bath.

PLATE XCVII.

Fig. 1. Shews a simple method, used in Britain, of constructing Cofferdams, by driving one row of Guaging Piles, and filling the spaces between them with Pile Planks driven vertically.
Fig. 2. Shews a very simple Caisson, as constructed by Mr Smeaton.
Fig. 3. Is the View of a Cofferdam employed for founding the Sea-Lock at the West Entrance of the Caledonian Canal.

PLATE XCVIII.

Represents the Caisson employed by Mr Labelye in laying the foundations of Westminster Bridge.

PLATE XCIX.

Represents the Centres of Blackfriars, Westminster, Neuilly, and Orleans Bridges.

PLATE C.

Represents the Centres of Conon, Tongueland, and Ballater Bridges; and also a new method of forming Centres for Large Arches, invented by Mr Telford.

PLATE CI.

Contains Sections of different parts of Westminster, Blackfriars, Orleans, and Dunkeld Bridges.

PLATE CII.

Contains an Elevation, &c. of the Foot Bridge over the River Clyde at Glasgow, designed by Mr Peter Nicholson.

PLATE CIII.

Represents the beautiful Bridge built at Alcantara in Spain, by the Emperor Trajan.

PLATE CIV.

Fig. 1. & 2. The Horizontal Plan of a Loom for Weaving Brocade. See p. 728.
Fig. 3. Shews the method of Common Spotting.
Fig. 4. Shews the method used for the Japan or Paper Spot.
Fig. 5. Represents a Brocade Lay.
Fig. 6. Represents the Brocade Segments.
